SEVIER, a salt lake in Millard County, in Utah, just west of the Beaver River Range, in lat. 30° N., long. 130° 10' W., and at an altitude of 4,000 feet. Sevier River enters it on the north and it has no apparent outlet. The water lines of the valley surrounding the lake show that at one time it was of considerable extent and was a part of Lake Bonneville (q.v.), together with Great Salt Lake, Lake Lakeshore and other bodies of salt water in the vicinity. In 1872 Sevier Lake was 28 miles long, 10 miles wide and had a surface area of 188 square miles. For over 30 years the waters of Sevier River have been used for irrigation, and so great is the quantity now used for this purpose that during the summer months the bed of the lake is almost dry and the salts have been precipitated so as to form a crust over the lake bottom. This crust is composed of about three-fourths sodium chloride and the other fourth is nearly all magnesium sulphate and sodium sulphate. The crust is estimated to be about 1,500,000,000 tons. The only animal life found in the lake are *Artemia*, a species of brown shrimp and the larvæ of some insects. Fishes entering the lake from the river are poisoned by the strong brine.

SÉVIGNÉ, Marie de Rabutin-Chantal, mā-rē dē rā-bū-tān shān-tāl sã-vên-yã, MARQUISE DE, French writer: b. Paris, France, 5 Feb. 1626; d. Grignan, Drôme, France, 17 April 1696. She was the daughter of Baron de Chantal, was left an orphan in 1633, and brought up by her maternal grandparents, and by her uncle, the Abbé of Livry. She was married in 1644 to the Marquis Henri de Sévigné, who was killed in a duel in 1651, leaving her the mother of a son and a daughter. Though gifted with wealth, beauty, talent and high social position, she made no second marriage, but devoted herself to the education of her children, and to reading, meanwhile moving as one of the most brilliant members of the literary circle of the Hôtel Rambouillet. She was devotedly attached to her daughter, who was married in 1669 to the Comte de Grignan, and shortly afterward accompanied him to Provence, where he had been appointed lieutenant-governor. This separation resulted in the voluminous correspondence, which, while not intended for publication, has since been given to the world, and has made the writer famous, the letters being models of literary style and of great historical value. They cover a period of only about seven years, as after 1687 Madame de Sévigné was rarely separated

from her daughter, who died in 1694. The correspondence abounds in delightful gossip, witty anecdote, clever remarks on men and topics of the day, and graceful delineation of the pleasures and gaieties of Parisian society. They mirror the life of the woman who was in turn the noted beauty of the court, the brilliant wit of the Hôtel Rambouillet, the religious devotee, the woman of business, endeavoring to make her income meet the demands placed upon it by her extravagant son, the appreciative student of Virgil, Montaigne, Molière, Pascal, Arnauld, Quintilian, Tacitus and Corneille, and always the devoted mother, deploring the enforced separation from her daughter. They fill 14 large volumes, and were first published in 1726. Successive editions have appeared at intervals, the best being that of Monmerqué in the 'Grands Ecrivains' series (14 vols., 1862-66), completed by the 'Lettres Inédites of Capmas' (2 vols., 1872). Consult Walckenaer, 'Mémoires touchant la Vie et les Ecrits de Madame de Sévigné' (1842); Combes, 'Madame de Sévigné historienne' (1885); Saporta, 'La famille de Madame de Sévigné en province' (1889).

SEVILLE, sêv'īl or sê-vīl', or **SEVILLA**, sã-vêl'yã, Spain, (1) capital of the province of the same name, on the east bank of the Guadalquivir, 62 miles northeast of Cadiz. The principal buildings are grouped around or near the Plaza del Triunfo. The great Gothic cathedral, which ranks next to Saint Peter's at Rome, was built (1401-1519) on the site of a Moorish mosque, and comprises a profusion of works of art and historical treasure, paintings by Murillo, De Vargas, etc., gilt and colored wood carvings by Dancart (1482), fine sculptures and superb metal work, costly and curious statues and reliquaries, a large organ, and above all the delicate Moorish stone and marble tracery which decorates the interior. In the nave are the tombs of Ferdinand III and of Ferdinand, the son of Columbus. The approach is made by a high flight of steps, and the cathedral is surrounded by the shafts of 100 antique columns. The east and north portals contain respectively some fine sculpture and bronze doorways. The immense clustered pillars, the magnificent stained glass by Flemish artists, and the Giralda (q.v.) or Bell Tower (the finest in Europe) are interesting features. North of the cathedral is the Patro de los Naranjos, with the library of Columbus — containing some valuable works and manuscripts — and the original Moorish fountain. The Alcázar is the chief specimen of Moorish architecture in Seville, and only second to the Alhambra in beauty and interest. It was founded in 1181, was the Arabian royal palace and was surrounded by walls and towers. Its most conspicuous features are the façade, the hall of ambassadors, and the patro de las muñecas. In the rear are beautiful gardens. The Exchange contains many historical documents. The Ayuntamiento or city hall is a fine specimen of the Renaissance, between the Plaza de la Constitucion and the Palaz de San Fernando. Adjoining is the Audiencia or Court of Justice. The other noteworthy buildings are the Casa de Pilatos (15th century), with a fine colonnade and courtyard and the Casa de las Dueñas, with numerous courtyards and nine fountains. The remarkable churches include *Omnium Sanctorum*, San Marcos, Santa Maria

la Blanca (an ancient synagogue), and La Caribad (the latter containing several *chef d'œuvres* by Murillo and J. de Valdes Leal. Many of the churches, in themselves uninteresting, contain masterpieces of sculpture and painting. The Museum contains works of art of inestimable value, representing the School of Seville (16th and 17th centuries). Other notable buildings include the University (1254) (1567), formerly a convent; the archbishop's palace; the royal cigar factory, "Fabrica de Tabacos," an enormous and palatial building, with many courts, fountains, and tropical plants; the palace of San Telmo and the picture gallery. The chief squares not mentioned are the Plaza Nueva, the Plaza del Duque, the large bull-ring, which ranks next to that at Madrid, and the Quemadero, the former scene of the *Autos-da-fé*. Las Delicias is a charming promenade along the river bank. The suburb of Triana is inhabited by gypsies and the poorer class. The Guadalquivir is a tidal river and navigable for large vessels into the city itself. Seville has always been an important commercial port. The exports include lead, quicksilver, iron ore, olives, oranges, cork and copper pyrites; the imports timber, drugs, chemicals, coal, coke, machinery, petroleum and coffee. The principal manufactures are tobacco, porcelain, hardware, soap, leather goods, chocolate, corks, etc. The Pickman tile factory at Cartuja is an old and noted porcelain manufactory. A railway connects the city with Cadiz and Cordova, and an iron bridge and two other bridges (one belonging to the railway) connect it with Triana (where typical peasant games and costumes are seen). Seville was first colonized by the Phœnicians, from whom it passed in turn to Romans, Vandals, Visigoths and Arabs and was finally taken by Ferdinand of Castile (1248), 300,000 Moors voluntarily seeking exile. It suffered many revolutions prior to this period, and later was depopulated by a yellow fever scourge. Under Soult (1810) the French robbed the city of her riches. The discovery of America gave the town considerable commercial importance as the seat of American trade. It is the birthplace of Velasquez Murillo and other celebrities. Pop. about 158,300. Consult Calvert, A. F., 'Seville' (London 1907); Gallichan, W. M., 'The Story of Seville' (London 1903).

(2) The province has an area of 5,428 square miles, and forms a part of Andalusia. The summits of the Sierra Morina rise at the north to a high elevation; south, the surface is low and fertile. The Guadalquivir is the principal river, and its affluents are the Genil, the Guadira, and the Guadalimar. The province is exceedingly fertile and produces all cereals and vegetables. The exports include tobacco, leather, paper, chocolate, silk and woolen goods, glass, soap and pottery. The chief European domestic animals are abundant, and in the higher districts occur copper, silver, lead, iron, coal, and salt mines, besides chalk and marble. Trade has developed rapidly by the building of railways in recent times. Four senators and twelve deputies represent the province in the Cortes. The chief towns are Seville (q.v.), Carmona, Constantina, Ecija, Lebrija, Marchena, Morón de la Frontera, Osuna and Utrera. Pop. about 613,000.

SÈVRES, sāv'r, France, in the department of Seine-et-Oise, on the Seine, lies about 10 miles southwest of Paris, and an equal distance from Versailles. Its celebrated porcelain manufactory, founded at Vincennes in 1745 and removed to Sevres in 1756, was purchased by Louis XV, 1760. In 1876 the old and dilapidated buildings were replaced by a new structure, erected in the park of Saint Cloud. The Porcelain Museum contains numerous articles of china collected from all over the world, which represent every age and clime. A technical School of Mosaics was established here in 1875. Besides the celebrated Sèvres vases, painted glass and mosaics are made. In the artistic pottery the *pâte-sur-pâte* (or layers) method is used—original to this manufactory. The general effect is that of a cameo, though possessing greater delicacy and rich coloring. (See CERAMICS; PORCELAIN). Sèvres has other manufactures of shawls, cordage, leather and chemicals. It was occupied by the German troops in 1870, bombarded by the French a few weeks later, and attacked by the troops of the Commune in 1871. Pop. about 8,500.

SÈVRES PORCELAIN. See PORCELAIN.

SEWALL, sū'al, Frank, American Swedenborgian clergyman: b. Bath, Me., 24 Sept. 1837; d. 7 Dec. 1915. He was graduated from Bowdoin in 1858, studied at the universities of Tübingen and Berlin, and afterward engaged in pastoral work in Ohio. He was president of Urbana University, Ohio, for 16 years, was engaged as a pastor in Glasgow, Scotland, for some time, and after 1890 was engaged at Washington, D. C. He wrote many books of a denominational and religious character, and translated with much success from French and Italian poetry. His works include 'The Christian Hymnal' (1867); 'Moody Mike' (1869); 'The New Metaphysics' (1888); translations, 'Poems of Giosue Carducci' (1892); and 'Sonnets of J. M. de Heredia' (1900); 'Swedenborg and Modern Idealism' (1902); 'Reason in Belief' (1906), etc.

SEWALL, Jonathan Mitchell, American poet: b. Salem, Mass., 1748; d. Portsmouth, N. H., 29 March 1808. He studied at Harvard, was for a time in trade, but took up the law, practised in Grafton County, N. H., and became register of probate there in 1774. His songs and verses appeared widely in American newspapers in the Revolutionary time, 'War and Washington' being among those familiar to the army. Probably a good share of his poetry was, like 'On Independence,' of the "pompous, rhetorical, and truly ligneous variety." But he wrote for a performance of Addison's 'Cato' at Portsmouth (1788), an epilogue, the concluding two lines of which are frequently quoted:

"No pent-up Utica contracts your powers;
But the whole boundless continent is yours!"

Sewall was a Federalist, and a "wit" of the time. A volume of his 'Poems' containing paraphrases of Ossian and of Washington's 'Farewell Address' appeared in 1801.

SEWALL, May Wright, American educator: b. Milwaukee, Wis., 27 May 1844. She

was graduated from the Northwestern University, Watertown, Wis., in 1866, and was married to Theodore Lovett Sewall (d. 1895) in 1880. She became prominently connected with various woman suffrage associations, lectured extensively on woman suffrage, and served as delegate to numerous congresses in connection with that movement. She was identified as a manager of the Columbian Exposition at Chicago in 1893; was appointed by President McKinley commissioner to the Paris Exposition and its congresses in 1900; and was associated in 1915 with the Panama-Pacific Exposition. She was principal of the Girls' Classical School founded in Indianapolis by her husband until she retired into private life. She published various articles on literary and reform subjects, besides 'Historical Résumé of the World's Congress of Representative Women,' and 'Women, World War, and Permanent Peace' (1916).

SEWALL, Samuel, American jurist: b. Bishopstoke, Hampshire, England, 28 March 1652; d. Boston, Mass., 1 Jan. 1730. He was graduated from Harvard in 1671, was ordained to the ministry, but was "diverted into a prosperous and benign secular career," started a printing-press at Boston, and entered public life as a member of the board of assistants. In 1692 he was made a member of the council and judge of the Probate Court, and in the latter capacity joined in the sentence of condemnation against witches at the time of the historic delusion. When he had realized his error he made in 1697 a public confession in church, and afterward spent therefor one day annually in fasting and prayer. He was appointed judge of the Supreme Court of Massachusetts, and from 1718 until his retirement in 1728 was its chief justice. He was possibly the first in America to attack negro slavery, publishing on the subject 'The Selling of Joseph' (1700), a three-page tract of much eloquence. But he is best known for his diary, a garrulous detail of every sort of minutiae, comparable in this sort to Pepys or Evelyn, and extending from 1674 to 1729. It naturally affords a most valuable source for the political and social history of the colony. In fact, "we have (Chamberlain) no other book like it." Tyler calls Sewall "great by almost every measure of greatness." The diary was printed in volume V of the fifth series of the 'Collections' of the Massachusetts Historical Society.

SEWARD, sū'ard, Anna, English poet: b. Eyam, Derbyshire, 1747; d. Lichfield, 25 March 1809. She was a daughter of Thomas Seward, canon of Lichfield, and was known as "the swan of Lichfield." Some of her earlier poetical efforts were an 'Elegy on the Death of Mr. Garrick' and an 'Ode on Ignorance.' Her literary aspirations were fostered by her fellow-townsmen, Dr. Erasmus Darwin, of whom she later wrote a 'Memoir' (1804). Her greater success was achieved with a 'Monody on the Death of the Unfortunate Major André' (1781), and an elegiac poem on 'Captain Cook' (1807). Horace Walpole declared she had "no imagination, no novelty," and Miss Mitford spoke of her as "all tinkling and tinsel—a sort of Dr. Darwin in petticoats." Her poems were

published in 1810 with a memoir by Sir Walter Scott.

SEWARD, Clarence Armstrong, American lawyer and politician, nephew of W. H. Seward (q.v.): b. New York, 7 Oct. 1828; d. Geneva, N. Y., 24 July 1897. He was graduated at Hobart College in 1848, studied law and practised in New York after 1854. He was judge-advocate-general of New York State in 1856-60; and served as Acting Assistant Secretary of State of the United States after the attempted assassination of Secretary of State Seward in 1865. He was active in the creation of the State of West Virginia; and assisted Judge Blatchford in preparing 'New York Civil and Criminal Justice' (1850).

SEWARD, Frederick William, American lawyer, son of W. H. Seward (q.v.): b. Auburn, N. Y., 8 July 1830; d. 1915. He was graduated from Union College in 1849, admitted to the bar in 1851 and for 10 years was one of the editors and owners of the *Albany Evening Journal*. In 1861 he was sent to apprise Lincoln of the plot to assassinate him in Baltimore, served as Assistant Secretary of State in 1861-69 and in 1877-81, and narrowly escaped death in defending his father from an assault, 14 April 1865. He went with Admiral Porter on the special mission to negotiate the treaties with West Indies in 1867, assisted in the purchase of Alaska, and in the negotiations for Pago-Pago Harbor, Samoa. He was a member of the New York legislature in 1875, State commissioner at the Yorktown Centennial Celebration in 1881 and in 1900 became president of the Sagaponack Realty Company. He published 'Life and Letters of William H. Seward' (1891); 'A West Indian Cruise' (1894), and numerous articles in reviews and magazines.

SEWARD, George Frederick, American diplomat, nephew of W. H. Seward (q.v.): b. Florida, N. Y., 8 Nov. 1840; d. 1910. He was educated at Union College, and in 1861 was appointed United States consul to Shanghai, China, where he remained until 1876, serving as consul-general from 1863. In 1876-80 he was Minister to China, but was recalled in the last-named year in consequence of refusing to undertake the negotiation of a treaty to restrict Chinese immigration. During his residence in China he was active in suppressing riots and in reducing piracy. He was vice-president of the North China branch of the Royal Asiatic Society after 1887, and after 1893 was president of the New York Fidelity and Casualty Company. He published 'Chinese Immigration in Its Social and Economic Aspects' (1881); 'Digest of System of Taxation of New York' (1902), etc.

SEWARD, William Henry, American statesman: b. Florida, Orange County, N. Y., 16 May 1801; d. Auburn, Cayuga County, N. Y., 10 Oct. 1872. He was graduated from Union College (1820), and having studied for the law, began practising at Auburn in 1823, but soon indicated a decided bent for politics, which gradually drew him away from the legal profession. In 1830 he was elected as an anti-Masonic candidate to a seat in the New York senate, and from that date he was, with few intervals, in one form or another, an effective and prominent leader in the councils that framed the policy

both in his own State and of the nation. In 1838 he was elected first Whig governor of New York by a majority of 10,421. Though his administration was rendered peculiarly difficult by the internal dissensions of his party, it was marked by wise measures of reform, which definitely added to Whig strength in the State. During his term many of the disabilities of foreigners were removed, the anti-rent troubles were adjusted, the natural history and geological survey of the State was commenced, the State museum of natural history was established and a bill was passed securing for fugitive slaves a trial by jury with counsel furnished by the State. He was re-elected in 1840. From 1843 to 1849 he was occupied largely with professional practice, though he delivered several addresses on political and other topics, among them one on the life and character of O'Connell, which is accounted one of his happiest oratorical efforts. He was elected in 1849 to the Senate, and there attained great influence as both a party leader and an adviser of President Taylor. In a speech of 11 March 1850 in favor of the admission of California, he spoke of the exclusion of slavery from all new States as demanded by "the higher law," a phrase which greatly offended Southern Democrats, and was made one of the battle cries of Abolition. Upon Fillmore's accession, Seward strongly opposed that President's pro-slavery attitude, though this was accepted by many Whigs in Congress. Having been re-elected senator in 1855, he took a leading part in the discussion immediately antecedent to the Rebellion. In an address at Rochester, N. Y., in October 1858, he made reference to the "irrepressible conflict" whose outcome must make the United States a nation either all of free labor or all of slave. In 1856 and again in 1860 he was the most prominent Republican candidate for the Presidential nomination, receiving on the first ballot at the Chicago convention in 1860 173½ votes as against 102 for Lincoln, who was eventually chosen. Seward, however, spoke for Lincoln in the West and East, and was made Secretary of State. This post he filled with notable efficiency, particularly in connection with the foreign relations of the government. He reorganized the diplomatic service, and by his able dispatches and the instructions furnished to representatives abroad retained the confidence of Europe, which had been ready to grant recognition and support to the Confederacy. A famous incident of his secretaryship was the correspondence with Great Britain apropos of the "Trent affair." When the Confederate agents, Slidell and Mason, were removed from the British ship *Trent*, their restoration was peremptorily called for and war seemed certain. The answer, formulated by Seward and slightly amended by Lincoln, by its skill, closed the matter. Great Britain, it said, now recognized the principle of exemption from search, contended for in the War of 1812 by the United States, which now, therefore, willingly released the prisoners. Seward insisted on redress for American citizens for depredations by the *Alabama* (see INTERNATIONAL CLAIMS). Secretary Seward firmly asserted the Monroe Doctrine in relation to the French invasion of Mexico, but, by avoiding a provocative attitude, which might have involved his government in a foreign war, was able

to defer the decision to a more favorable time. Before the close of the Civil War he intimated to the French government the irritation felt in the United States in regard to its armed intervention in Mexico. Many dispatches on this subject were sent during 1865 and 1866, which gradually became more urgent, until the French forces were withdrawn and the Mexican Empire fell. Seward supported Lincoln's proclamation liberating the slaves in all localities in rebellion, and three years later announced by proclamation the abolition of slavery throughout the Union by constitutional amendment. In the spring of 1865 Mr. Seward was thrown from his carriage, and his arm and jaw were fractured. While he was confined to his couch with these injuries President Lincoln was murdered and on the same evening, 14 April, one of the conspirators gained access to the chamber of the Secretary, inflicted severe wounds with a knife in his face and neck, and struck down his son, Frederick W., who came to his rescue. He negotiated treaties for the purchase of the Danish West India Islands and the Bay of Samoa, which failed of approval by the Senate, and made a treaty with Colombia to secure American control of the Isthmus of Panama, which had a similar fate. Seward sustained the reconstruction policy of President Johnson, and thereby alienated the more powerful section of the Republican party and subjected himself to bitter censure and ungenerous imputations. He opposed the impeachment of the President in 1868, and supported General Grant for the Presidency in the same year. He retired in March 1869, afterward visited Alaska and made a tour of the world in 1870. He negotiated the purchase of Alaska from Russia. He published a 'Life' of J. Q. Adams (1849). An edition of his 'Works' appeared in 1853, including speeches, addresses and essays. His orations and speeches appeared in five volumes (New York 1890) and by order of Congress his official correspondence was published. Consult Bancroft, F., 'Life of W. H. Seward' (2 vols., New York 1899); Hale, E. E., 'William H. Seward' (Philadelphia 1910); Lothrop, T. K., 'William Henry Seward' (in 'American Statesmen Series,' new ed., Boston 1899); Seward, Oliver, 'William H. Seward's Travels Around the World' (New York 1873); Welles, Gideon, 'Lincoln and Seward' (ib. 1874).

SEWARD, Alaska, town on Resurrection Bay, Kenai Peninsula, off the Gulf of Alaska, 340 miles south of Fairbanks, and the southern terminal of the Alaska Northern Railroad. It is important as a winter railroad headquarters. Pop. 534.

SEWARD, Neb., city, county-seat of Seward County, on the Big Blue River, and on the Chicago, Burlington and Quincy and the Chicago and Northwestern railroads, about 26 miles west by north of Lincoln, the capital of the State. It is in an agricultural and stock-raising region, in which wheat and corn are the chief farm products. The city has flour mills, grain elevators, stock yards and creameries. There is a large trade in grain and livestock. Pop. 2,106.

SEWARD PENINSULA. See ALASKA.

SEWELL, Jonathan, Canadian jurist: b. Cambridge, Mass., 1766; d. 1839. He was edu-

HON. WILLIAM S. SEWARD

cated at Bristol, England, and in 1785 he settled in Canada. He studied law, was called to the bar in 1789 and engaged in practice at Quebec. He was appointed solicitor-general in 1793, and in 1795 became attorney-general and judge of the Court of Vice-Admiralty. In 1808-38 he was chief justice of Lower Canada. He made the decision concerning the disputed boundaries of Ontario, in 1818. He was president of the executive council in 1808-29; and from 1809 he was speaker of the legislative council. He is said to have made the original proposal for the Canadian federation while in England in 1814. Author of 'Plan for the General Federal Union of the British Provinces in North America' (1815); 'Essay on the Judicial History of French Law so Far as it Relates to the Law of the Province of Lower Canada' (1824).

SEWELL, Robert van Vorst, American artist: b. New York, 1860. He was graduated at Columbia University in 1883, and studied art under Boulanger and Lefebvre in Paris. He was awarded the Hallgarten prize of the National Academy of Design in 1888. He specialized in mural decoration. Among his works are the mural painting 'The Canterbury Pilgrims' in the great hall at Georgian Court, Lakewood; and 'The Story of Psyche,' a series of lunette decorations in the palmroom at the Saint Regis Hotel, New York.

SEWELL, William Joyce, American statesman: b. Castlebar, Ireland, 6 Dec. 1835; d. Camden, N. J., 27 Dec. 1901. He came to the United States in 1851, served as a sailor for a time and later engaged in business. He commanded a brigade at Chancellorsville, where he led a brilliant charge and was badly wounded. He was wounded also at Gettysburg, and served creditably on other battlefields. At the close of the war he was brevetted brigadier-general and major-general. He was interested in railroad affairs after the war; was elected to the New Jersey senate in 1872, and was president of that body in 1876, 1879 and 1880. He was United States Senator from New Jersey in 1881-87 and 1895-1901. In 1899 he became major-general of the New Jersey National Guard.

SEWELLEL, a terrestrial rodent (*Haplodon rufus*) which is formed into a family by itself, and regarded as a connecting link between beavers and squirrels. It is represented by a single species (*H. rufus*), restricted to "a small area on the west coast of North America, in Washington, Oregon and California." The aborigines called it "Showt'l" or "Sewellel," the trappers the "Boomer" or "Mountain Beaver." The animal is plump, with broad head, short limbs and hardly any tail; measures about a foot in length; and has a brownish color. It lives socially in colonies, burrows underground and lives on vegetable matter. It dwells in wet places in which the vegetation is rank and dense. For its winter store it collects great quantities of woody plants and ferns, which it dries thoroughly in the sun before putting in storage for the winter. As a connecting link *Haplodon* is of much interest to naturalists, while the Indians use its skin and also its flesh.

SEWERAGE. See SANITARY ENGINEERING.

SEWICKLEY, Pa., borough in Allegheny County, on the north bank of the Ohio River, 14 miles northwest of Pittsburgh, and on the Pennsylvania Railroad. It is chiefly residential in character as a suburb of Pittsburgh, and is patronized as a summer resort. There are natural gas and petroleum in the district. The borough has a high school, library and hospital. Pop. 4,479.

SEWING MACHINES. On 17 July 1790 Thomas Saint, an English cabinet-maker, secured a patent on a machine to be used for "quilting, stitching and sewing, making shoes and other articles." The patent was for some sort of a machine connected with boot-making, and the specifications and drawings of the patent comprised, among other things, a crude stitching device for forming a chain-stitch. This patent was discovered a few years ago by a searcher among the ancient archives of the British Patent Office, where it had lain unnoticed for well-nigh a century, no attempt, so far as is known, having ever been made to introduce into practical use the mechanisms described in the patent. Between 1790 and 1841 several parties obtained patents for stitching devices, making the tambour and chain-stitches, none of which was commercially successful, one of the fatal defects in each being the fact that the cloth had to be fed by hand. When, in 1841, Newton and Archbold patented in England a needle with an eye near the point, in connection with a glove-stitching machine and which is essentially the same needle now in use by all sewing-machine manufacturers, one of the greatest difficulties that had theretofore stood in the way of making the sewing machine a practical success was overcome. In 1818 a sewing machine which made a back-stitch was invented by the Rev. John Adams Dodge, of Monkton, Vt., but was neither patented nor manufactured for sale. The first sewing machine put into operation was patented in France, in 1830, by Barthélemy Thimonnier, and though it was rudely made of wood, nearly 100 of them were collected in a factory used in the manufacture of clothing for the French army. The entire plant was later destroyed by a mob. In 1848 Thimonnier put another machine on the market and on 3 Sept. 1850 took out a patent in the United States. These later machines were made of metal.

A machine having a needle with an eye near the point attached to the end of the vibrating arm was invented and manufactured in 1832-34, in New York, by a machinist named Walter Hunt. This machine was a lock-stitch and used two continuous threads. Hunt sold his idea to a blacksmith named Arrowsmith and through him the combination of the two threads and the needle with the eye near the point became public property. In 1853 Hunt endeavored to patent his idea, but it had been covered by a patent to Elias Howe in 1846. In 1842 a machine for sewing leather and various other heavy materials was invented by J. J. Greenough but this did not become generally used. In 1843 a machine somewhat similar to the Greenough machine was invented by George H. Corliss. This had an automatic feed and the needles, of which there were two, were run horizontally through the goods to be sewed. Numerous other inventions were made between the years 1849 to

1851, the most important of these being the machine for the manufacture of clothing made by Lerow and Blodgett. This had a curved shuttle, adjustable feed and automatic tension and the baster-plate consisted of a circular hoop studded with pins. The next invention patented that covers a fundamental and important feature was that of John Bachelder, patented 8 May 1849. Bachelder's machine was the first to embody the horizontal table with a continuous feeding device that would sew any length of seam. His invention consisted of an endless leather belt set with small steel points projecting through the horizontal table and penetrating the material to be sewed, carrying it along intermittently at a proper time to meet the action of the needle.

Elias Howe, Jr., began his experiments in 1843 and secured his first patents 10 Sept. 1846. Howe's principal improvements were the shuttle, producing the lock-stitch, and the feed motion. Later, Howe made other improvements, but the machine bearing his name was not patented until 1857. Howe's invention consisted of the combination of the eye-pointed needle with a shuttle for forming a stitch and an intermittent feed for holding and carrying the material forward as each stitch is formed. The mechanical device for the feed was called the "baster-plate," and the length of the seam sewed at one operation was determined by the length of this plate. The material to be sewed was hung by pins to the "baster-plate" in an upright position and if the seam to be sewed was of greater length than the plate it was necessary to rehang it on the plate, which was moved back to position in the same manner as a log is carried back and forth in a saw-mill.

In 1847 Allen B. Wilson, then working as a journeyman cabinet-maker in Adrian, Mich., conceived the idea of a sewing machine, although he had never heard of one. He did not complete full drawings of his machine until the latter part of 1848. Early in 1849 he determined to build a model, and began, on 3 Feb. 1849, the construction of his first machine, which he completed in about 60 days. Having been compelled, by lack of means, to construct every part of the machine himself, the iron and steel as well as the wood, although he was not a practical machinist and lacked suitable tools for the metal work, the machine was consequently of imperfect construction and could not illustrate in the best manner the principles of his invention. It worked, however, and with it were made dress waists and other articles that severely tested its capacity. This machine made the lock-stitch, the lower thread being carried by a double-ended shuttle. The machine contained the first automatic feed movement ever produced and was the first that could sew curved seams or turn a sharp angle. Without such a device, the machine would have been a practical failure, as Howe's really was, and as well all others until Mr. Wilson's inventions. His first device was what is known as the "two-motion feed," to distinguish it from his "four-motion feed," a still more effective device afterward invented by him. The "two-motion feed" consisted of a horizontally reciprocating tooth surface (the pitch of the teeth being forward) engaging the material at all times, and while the needle was in the material moving back to take a new stroke. A patent

on this machine was granted Mr. Wilson on 12 Nov. 1850. Wilson had, while in New York, come into contact with a Mr. Wheeler who had invented the revolving hook for handling the upper thread below the plate and forming the stitch. He constructed a model of a machine containing a rotary hook and reciprocating bobbin, gave all his energies to perfecting the new machine and obtained a patent for it 12 Aug. 1851. Joined by Newton the three men formed the firm of Wheeler and Wilson.

It is a remarkable coincidence that on the same day a patent was granted to Isaac M. Singer for his first machine. The main features of the Singer machine were its straight needle, working at the extremity of a stationary overhanging arm, and its feed, consisting of a roughened wheel. A straight shaft in the overhanging arm imparted the motion to the needle, and the shuttle was driven in its race below the feed table by a mechanism deriving its motion from the shaft by means of toothed gearing. The feed consisted of an iron wheel with a corrugated surface, the top of which was slightly elevated above the level surface of the table. By an intermittent motion the feed carried the cloth forward between stitches without injury to the fabric. This device permitted the cloth to be turned in any direction by the operator while sewing, which was impossible with the styles of feed which perforated the goods. The material was held in place by a presser foot alongside the needle. This presser foot embraced an important feature possessed by no other sewing machine up to that time—the yielding spring, which would permit of passage over seams, and adjust itself automatically to any thickness of cloth. It was claimed that this was an improvement over Mr. Wilson's first feed, in that there was no backward motion while in contact with the cloth. It had, however, the disadvantage of touching the cloth only on a small portion of its periphery—theoretically at only a point, and practically only a little more. It was claimed by Messrs. Wheeler and Wilson to be really an infringement of Wilson's patent, the principle of which was the holding of the cloth between a roughened or toothed surface on the under side and a smooth surface touching it with an intermittent motion, permitting the turning of the cloth in either direction while the machine was in motion; and this claim was sustained by the court.

On 19 Dec. 1854, a patent was issued for Mr. Wilson's celebrated "four-motion feed," so called from the peculiarity of the device by which the flat-toothed surface of the feed, being in contact with the cloth, is moved forward, carrying the cloth with it; then drops out of contact with the cloth, is moved backward and then rises up against the cloth and is again ready for the first motion. This device solved the problem of a thoroughly practical and effective feed, and was soon generally adopted and has become the feed motion of all makes of sewing machines. This feed motion, although it was not patented until this late date, had been long previously invented by Mr. Wilson, and was described in his application for a patent in 1851, but the claim was not pursued for the reason that he believed at the time that he had been anticipated by W. O. Grover, of the firm of Grover and Baker. It

was ascertained afterward, however, that Mr. Wilson was really prior in the invention, and, without contest on the part of Mr. Grover, the patent was granted to Mr. Wilson. This machine was invented by Grover and Baker on 11 Feb. 1851 and had a double-loop stitch made by a combination of a circular reciprocating under needle and a curved upper needle with an eye near the point. This eliminated both shuttle and bobbin and rendered it possible for the upper and under threads to be taken from commercial spools. These machines, though once popular, are not now manufactured.

In 1855 litigation arose involving the three principal sewing-machine companies then in existence, each claiming that the others were infringing upon certain of their patent rights, and numerous suits were instituted, more particularly by Howe, whose patents were so skillfully drawn that he claimed all others were infringements.

In 1856 the three principal sewing-machine companies — Wheeler and Wilson, Singer and the Grover and Baker — formed a combination. It was contracted by the three companies and Mr. Howe that they would stop their litigation, and, with a fair payment to each other and to Mr. Howe for special rights, would carry on the business with only honorable competition. They finally agreed to license any responsible person who should propose to engage in the manufacture of a good machine on the payment of a royalty, which for several years was \$3 on a machine.

The next machine to be put on the market was the Willcox and Gibbs. This machine, which had a rotating hook for using a single thread to make the twisted loop-stitch, was first patented in June 1857 by James E. H. Gibbs, a farmer of Millpoint, Va. Later James Willcox, of Philadelphia, added some further improvements, and the machine then became known as the Willcox and Gibbs. Several years afterward an automatic tension was placed on this machine by Charles H. Willcox.

While the manufacture of machines for the home has been developing and progressing, those for manufacturing purposes have in no less a degree been brought to a state bordering on perfection. The most recent development is the oscillating shuttle machine of the Singer Company which makes up to 50 stitches per second with scarcely any apparent friction. The single thread chain-stitch machine is faster than the double thread lock-stitch, making up to 4,000 stitches per minute. There are now machines for making — or which have special attachments for making — every conceivable article of clothing, upholstery, embroidery, leather goods, etc. We have the button-hole, the button-sewer, the French-knot, the faggotting, feather-stitching, hemstitch, side and box-plaiters, corset machines; the cylinder for seam work on sleeves, trousers, bootlegs, leather buckets, etc.; machines for embroidery, smocking, carpet, awnings, tents, etc.; the single and double-needle machines and those with four, six and eight needles for glove work, special machines for overalls, sail-making, flag-making and a host of others too numerous to mention. A special class known as high-speed machines is used in factories where clothing is made in

quantity. They are run by individual dynamos. Many of the machines may be used for several different purposes by simply changing the style of feed motion, presser foot, needle, etc., while the other parts of the mechanism remain substantially the same. There have been several thousand patents granted on sewing machine appliances and attachments.

The production of sewing machines has become a wonderful industry in the United States, which leads the world in their manufacture. In 1914 there were 46 concerns engaged in the industry, capitalized at \$34,446,624; employing 14,308 wage-earners, with wages of \$8,860,843; cost of material used, \$7,359,664; and the value of their production was \$21,391,917. Besides these there were 4 establishments making sewing-machines cases, with an invested capital of \$6,425,153 and employing 3,699 hands; producing goods annually to the value of \$5,845,663. In the same year the exports of sewing machines with and without cases amounted to \$8,658,762. Consult Hasluck, P. N., 'Sewing Machines: Their Construction, Adjustment and Repair' (London 1905).

SEX IN PLANTS. See PLANTS, SEX IN.

SEXAGESIMA (sěks-a-jěs'i-ma) **SUNDAY**, the second Sunday before Lent. See QUINQUAGESIMA.

SEXTANT, a portable instrument for measuring the altitudes of the heavenly bodies above the horizon, or their angular distance as seen in the sky. It was invented independently by Thomas Godfrey, of Philadelphia, and Captain Hadley of the British navy, about 1730. The principles on which it works will be seen by a study of Fig. 1. C is a plain flat mirror, of which the polished side is turned downward

FIG. 1.

and toward the left. H is a flat plate of polished glass through which an eye placed at E may view a distant object in the direction K by light coming through it in the direction of the dotted lines. Light emanating from another object O or P and falling on the mirror C will, where the mirror is properly directed, be reflected along the line CH and, in striking the glass plate H, a certain portion of it will be reflected in the direction HE, so that the observer with his eye at E will see both the objects K and O or P in coincidence. If the mirror C is set parallel to H as in the figure, the rays KE and OC will be parallel, and may, therefore, be considered as emanating from the same object at an infinite distance.

Thus the eye will see two images in the mirror as if together. But if the mirror C be moved into a different direction, that shown by the dotted line AB for example, the direction of the ray, the direction of the line PC, the rays along which are reflected to H, will deviate from OC by double the angle through which the mirror has turned. This doubling is caused by the fact that the angles of incidence and reflection are both changed by the motion of C. It follows that if the observer can measure the angle between the mirror C and H, doubling this angle will give him the difference of direction between the rays coming from K and from P.

The sextant is used to measure this angle. The essential parts of it are shown in Fig. 2. The part ABC consists of the arc AB round C as a centre and firmly fastened by the radii CB and CA which are again firmly connected by a framework not shown in the figure. To this framework is attached the fixed plate of glass H, of which the lower half is silver while the upper half is transparent. T is a telescope, also firmly fixed to the frame, through which the eye looking in at E may see a distant object through the transparent portion of the mirror, and at the same time see any other object by the light reflected from the silvered part. The arc AB is graduated to degrees and fractions as shown by the figures. Owing to the doubling of the angle, the measures on the arc BA are also double. That is to say, this arc is only 60 degrees in length, but is divided into 120 degrees, so as to show the actual altitude of the object observed.

FIG. 2.

RM is a movable arm carrying a mirror C called the index glass, fixed to it perpendicularly at its upper end. The arm revolves around C as a centre. At its lower end there is an index mark and vernier by which the position of the arm with respect to the graduations on the arc may be determined.

The altitude of a heavenly body at C is then measured by the observer taking the instrument in his hand and holding it in a vertical position, with the telescope ET horizontal, so that the sea horizon may be seen through the transparent part of the horizon glass H. The

observer facing in the vertical plane of the sun or other object then turns the arm RM around the centre C until he brings the sun into sight, through its rays being reflected first from C and then from H. When the limb of the sun is thus made to coincide with the horizon, the angle through which the arm RM has moved from parallelism is shown by the position of the index on the graduated arc BA, which is then determined by the vernier.

In ordinary use the navigator never has to measure angles exceeding 90 degrees. In this case the arc BA need only to be 45 degrees in actual length. The instrument is then called a quadrant. This was the original form used by Hadley.

For very accurate use the arc is extended down so as to form a complete circle. A special device is employed to bring about the proper reflection of the light; but the reflecting circle, as the instrument is called, is too complicated to admit of common use by the navigator.

SIMON NEWCOMB.

SEXTET (from Lat. *sextus*, sixth). In music, a composition for six voices or instruments, or for voices with instrumental accompaniment. Instrumental sextets are generally compositions in sonata form.

SEXTON, Alexander Humboldt, English metallurgist: b. London, 11 Sept. 1853. He was educated at the Royal School of Mines, London, the Royal College of Science, Dublin, and at the universities of Glasgow and Edinburgh. He was lecturer on chemistry and metallurgy at the Manchester Technical School in 1882-84; and from 1884 until 1909, when he retired, he was professor of metallurgy at the University of Glasgow and at the West of Scotland Iron and Steel Institute. Author of 'Elementary Chemistry'; 'Fuel and Refractory Materials'; 'Alloys'; 'Chemistry of the Materials of Engineering,' etc.

SEXTON, Frederick Henry, Canadian engineer and educator: b. New Boston, N. H., 9 June 1879. He was educated at the Massachusetts Institute of Technology and was professor of metallurgy there in 1901-02. He was assistant professor of mining and metallurgy at Dalhousie University, Halifax, Nova Scotia, in 1903-07; and since 1907 has been president of the Nova Scotia Technical College. Since 1916 he has also had charge of the vocational training school for returned soldiers of the Quebec and Maritime provinces. He is author of many technical papers.

SEXTON, a church officer whose duties consist in taking care of the church generally, to which used to be added the duty of digging and filling up graves in the churchyard, when the church had a cemetery attached to it. In the United States the sexton is also very often an undertaker, and thus continues in a form different from the old-time sexton, to attend to the interment of church members. The term sacristan, of which sexton is a corruption, applies more particularly to an official in the Roman Catholic and Anglican churches, who has charge of the sacristy and its contents, and of the vestments worn during the service. He occupies a considerably higher rank than the

ordinary sexton, and in English cathedrals is often a minor canon

SEXTUS (surnamed **EMPIRICUS**, from his belonging to the empiric school of medicine) was a sceptic who flourished in the first half of the 3d century. He was a Greek by birth, and lived at Alexandria and Rome. Scepticism appears in his writings in the most perfect state which it reached in ancient times. (See **SCPTICISM**). We have two works by him, written in the Greek language, and they are the source of our knowledge of the Greek sceptical philosophy. One of them entitled 'Outlines of Pyrrhonism' in three books, explains the method of Pyrrho; the other, entitled 'Against the Mathematicians,' is an attempt to apply that method to all the prevailing philosophical systems and other branches of knowledge. Consult the edition of his works by J. A. Fabricius (Leipzig 1718) and by Bekker (Berlin 1842); also Brochard, 'Les sceptiques grecs' (Paris 1887); Christ-Schmid, 'Geschichte der griechischen Literatur' (Vol. II, pt. 2, Munich 1913) and Pattrick, 'Sextus Empiricus and the Greek Sceptics' (Cambridge 1899).

SEXUAL SELECTION, a term invented by Darwin to denote a special phase of natural selection, depending on a competition between rival males, in which a premium is set on those qualities which favor their possessors in securing mates. This competition takes two forms: On the one hand, rival mates, for instance, stags or gamecocks, fight with one another and the conquerors have naturally the preference in mating; on the other hand, rival males sometimes seem to vie with one another in displaying their attractive qualities before their desired mates, who, according to Darwin, choose those that please them best. Darwin gives the following summary of his theory:

"It has been shown that the largest number of vigorous offsprings will be reared from the pairing of the strongest and best-formed males, victorious in contests over other males, with the most vigorous and best-nourished females, which are the first to breed in the spring. If such females select the more attractive and, at the same time, vigorous males, they will rear a larger number of offspring than the retarded females, which must pair with the less vigorous and less attractive males. So it will be if the more vigorous males select the more attractive and, at the same time, healthy and vigorous females; and this will especially hold good if the male defends the female, and aids in providing food for the young. The advantage thus gained by the more vigorous pairs in rearing a larger number of offspring has apparently sufficed to render sexual selection efficient."

In regard to the second aspect of sexual selection, in which the females are believed to exercise some choice, giving the preference to those suitors which have brighter colors, more graceful forms, sweeter voices or greater charms of some kind, there is no little difference of opinion. Darwin indeed believed strongly in the female's choice and referred to this process of selection many of the qualities which distinguish male animals. The females "have by a long selection of the more attractive males added to their beauty or other attractive qualities." On the other hand, Alfred Russel Wallace maintains a very different position. "There is," he says, "a total absence of any evidence that the females admire or even notice the display of the males. Among butterflies there is literally not one particle of evidence that the female is influenced by color or even that she has any power of choice, while there is much

direct evidence to the contrary." Against this, G. W. and E. G. Peckham, in their careful essay on sexual selection in spiders, state that they have in the *Attidæ* "conclusive evidence that the females pay close attention to the love dances of the males and also that they have not only the power, but the will, to exercise a choice among the suitors for their favor." Some observers of birds are also confident that the females choose the more musical or otherwise attractive males. But again Wallace maintains that the fact that every male bird finds a mate "would almost or quite neutralize any effect of sexual selection of color or ornament; since the less highly colored birds would be at no disadvantage as regards leaving healthy offspring."

The theory of sexual selection is of considerable importance in a general theory of evolution. This may be illustrated in reference to the bright plumage of many birds. If we postulate successive crops of variations (which cannot at present be completely rationalized), if we acknowledge that there is really "preferential mating" among birds (which is not readily proved or disproved), if we believe that the females are sensitive to the slight excellences which distinguish one suitor from another and that their choice of mates is determined by these excellences (which Wallace emphatically denies), then we may say that the greater brightness of male birds may have been evolved by sexual selection. This was Darwin's opinion. The brighter males succeeded better than their rivals in the art of courtship; the variations which gave them success were transmitted to the offspring; gradually the qualities were established and enhanced as secondary sexual characters of the species. But Wallace interpreted the facts quite otherwise. The relatively plain plumage of the female birds was due to natural selection, eliminating those whose conspicuousness during incubation was fatal, fostering those whose coloring was protective. Just as Daines Barrington, a naturalist, still remembered as the correspondent of Gilbert White, suggested (1773) that singing birds were small and hen birds mute for safety's sake, so Wallace maintained that female birds had forfeited brightness as a ransom for life.

The doubts and difficulties arouse scepticism as to the thoroughness of the explanations of secondary sexual characters suggested either by Darwin or by Wallace. It is not surprising, therefore, to find Mivart's explanation of the beauty of males as the direct expression of an internal force, or Mantegazza's hints as to physiological explanation of the sexual divergence, or Brook's reference to "something within the animal which determines that the male should lead and the female follow in the evolution of new breeds." Geddes advanced further, endeavoring to interpret the secondary sexual characters as outcrops of the relative preponderance of anabolism and katabolism characteristic of females and males respectively. Gay coloring—sometimes at least due to pigmented waste products—is regarded as a characteristic expression of the predominantly katabolic or male sex and quiet plainness is equally natural to the more anabolic females. But this theory, which seeks to rationalize the variations which Darwin simply postulated, is by no means inconsistent with a recognition of sexual selection as an accelerant directive process in the evolu-

tion of male brightness, or of natural selection as a retardative directive process eliminating disadvantageously conspicuous females.

Wallace in his later works advanced toward a rational interpretation of the variations which he was previously content to postulate as facts. For he says that "ornament is the natural outcome and direct product of superabundant health and vigor," and is "due to the general laws of growth and development." It seems to some that this mode of interpreting characters is of far-reaching importance and that it affects not only the theory of sexual selection but that of natural selection as well.

To sum up, the problems involved in sexual selection are (1) what physiological conditions explain the secondary sexual characters which so often distinguish males and females; (2) to what extent and in what degree of refinement does preferential mating occur; and (3) to what extent has sexual selection guided the differentiation of the sexes alike in distinctive qualities and in æsthetic sensitiveness? Before these problems can be adequately solved many more facts must be accumulated.

SEYCHELLES, sâ-shêl', a group of islands in the Indian Ocean, belonging to Great Britain. Their formation is peculiar, as they are the only tropical islands of granite structure. The archipelago comprises 80 islands, rising precipitously from the water to a height of 2,998 feet in the largest of the group, Mahé, which has an area of 55½ square miles. Smaller islands of the group are Praslin, Silhouette, La Digue, Curieuse and Félicité. Formerly the group was administered from Mauritius but in 1888 the office of administrator was created, an executive council of two ex officio members and one nominated member was appointed and a legislative council of six members. In 1915 the revenue was \$127,000, the expenditure \$155,500 and the debt \$60,000. Exports in 1915 were valued at \$462,340 and imports at \$280,000. Mahé is central and, with a few of the others,

is inhabited. The white sandy beaches are enclosed by coral reefs. The soil is fertile, the climate temperate. There are many brooks and streams. The islands are covered with verdure (enormous ferns, sensitive plants and palms grow) and valuable woods, adapted to cabinet work or shipbuilding. Vanilla, coffee, cocoa, spices, tobacco, corn, tropical fruits and vegetables are grown. The exports are the fibres, nuts and oil of the cocoanut palm; vanilla, soap, tobacco, tortoise-shell and vacoa bags. The imports are cotton, coal, wine, coffee and cotton goods. Coco-de-mer (q.v.) is peculiar to Praslin. Enormous tortoises of the edible sort are common. The adjacent seas contain numerous fish, some of gorgeous colors. The inhabitants construct their homes of a species of coral which glistens like marble and is hewn into massive blocks. The chief harbor is Port Victoria, on Mahé Island. There is much land suitable to, but not as yet under, cultivation. The Seychelles were discovered by the Portuguese and first colonized by the French (1743), of whom the present inhabitants are descendants. The British captured the islands in 1794 and at the peace of 1814 they were ceded to them. Pop. about 24,000. Consult Belcher, E., 'Account of the Seychelles'; Fauvel, A. A., 'Bibliographies des Seychelles' (1908); Gardiner, J. S., 'The Seychelles'; Hartman, 'Madagascar und die Inseln Seschellen' (Leipzig 1886).

SEYCHELLES COCOANUT, a palm (*Lodoicea sechellarum*), peculiar to the Seychelles Islands, sometimes 100 feet high, crowned by immense palmate leaves, which make good material for hat plaiting and basketry, and when mature are used for house partitions and for thatching. The fruits are gigantic in size, sometimes weighing as much as 50 pounds and were anciently supposed to grow on submarine palms, since they were found only when washed ashore on Asiatic coasts. This circumstance caused many superstitions to arise, especially that they were a powerful cure for snake poison, and they, therefore, commanded high prices in the East and were called coco-der-mer, sea, double or Maldivé cocoanuts. There are from one to four stony nuts in a husk, each being deeply lobed at each end. This floating apparently double nut may have given rise to the types of twin boats. The unripe fruit is edible and the hard black shell of the nuts is carved into ornaments and fakers' drinking cups. See PALMS.

SEYFFARTH, zî'fârt', Gustave, American educator and Egyptologist: b. Uebigau, Saxony, 13 July 1796; d. New York, 17 Nov. 1885. He was educated at the University of Leipzig and under Champollion in Paris. He was professor of Oriental archæology at the University of Leipzig in 1825-55, afterward emigrating to the United States. He was professor of archæology and exegesis at the Concordia Lutheran Theological Seminary, Saint Louis, in 1855-71. He then retired and lived in New York. He was a lifelong student of Egyptology and made many translations. Author of 'De Sonis literarum græcarum tum genuinis tum adoptivis libri duo' (1823); 'Systema Astronomiæ Ægyptiacæ' (1833); 'Theologische Schriften der Alten Aegypter' (1855); 'Summary of Recent Discoveries in

Bible Chronology' (1857); 'Chronologia Veterum' (1871), etc.

SEYMOUR, sē'môr, a noble English family of Norman origin. Their name is corrupted from Saint Maur, their seat in Normandy. They acquired lands in Monmouthshire in the beginning of the 13th century and early in the 15th century added to these estates others in Somersetshire. The first member to become conspicuous was Sir John Seymour, the father of the third wife of Henry VIII and of Edward Seymour, protector of the realm of England during the minority of Edward VI, whose uncle he was. He commanded in a maritime expedition against the Scots in 1544, when he landed a body of troops at Leith and set fire to the city of Edinburgh. By the will of Henry he was nominated one of the council of regency during the minority of Edward VI; but, not content with his share of power, he procured himself to be appointed governor of the king and protector of the kingdom (January 1547). In the month following he obtained the post of lord-treasurer, was created first Duke of Somerset and made earl-marshal. The same year he headed an army, with which he invaded Scotland, and after having gained the victory of Musselburgh returned in triumph to England. His success excited the jealousy of the Earl of Warwick and others, who procured his confinement in the Tower. Six months after he obtained a full pardon from the king and was ostensibly reconciled to his adversary, Lord Warwick. The reconciliation was probably insincere, as Warwick caused Somerset to be again arrested, in October 1551, on the charge of treasonable designs. He was tried, found guilty, attainted and beheaded on Tower Hill in January 1552. His eldest son by his second wife was created by Elizabeth, Earl of Hertford. The Earl of Hertford under Charles II having distinguished himself in support of the royal cause during the Parliamentary war obtained in his favor the revival of the title of Duke of Somerset and took his seat in the House of Lords as second duke in 1660. On the extinction of his line the descendants of the first Duke of Somerset by his first wife claimed the title and on the advice of the attorney-general that claim was pronounced good by the House of Lords, in which body the descendants of that claimant still hold a place. Consult Locke, A. A., 'The Seymour Family' (London 1911) and St. Maur, R. H., 'Annals of the Seymours' (ib. 1902).

SEYMOUR, George Franklin, American Protestant Episcopal bishop: b. New York, 5 Jan. 1829; d. Springfield, Ill., 8 Dec. 1906. He was graduated from Columbia in 1850, from the General Theological Seminary in 1854 and ordained in the priesthood in 1855. He held various charges in New York State, founded Saint Stephen's College at Annandale, N. Y., in 1855 and was its warden until 1861. In 1865-79 he was professor of ecclesiastical history at the General Theological Seminary, of which he was also dean in 1875-79, and in 1878 he was consecrated first bishop of Springfield. In 1897 he represented his church at the Congress of Old Catholics at Vienna. He published 'What is Modern Romanism' (1885); 'Marriage and Divorce' (1893); 'The Church

Idea of the Family' (1899); 'Sacraments and Principles of the Church' (1903), etc.

SEYMOUR, Horatio, American statesman: b. Pompey Hill, Onondaga County, N. Y., 31 May 1810; d. Utica, N. Y., 12 Feb. 1886. He was educated at Geneva Academy (now Hobart College) and at a military school at Middletown, Conn.; studied law at Utica and was admitted to the bar in 1832. In 1833 he became military secretary to Governor Marcy and held the position six years. He was elected to the State assembly by the Democrats of Oneida County in 1841; was mayor of Utica in 1842; re-entered the assembly in 1843 where, as chairman of the committee on canals, he outlined the policy subsequently followed by the State. He was chosen speaker in 1845 and nominated for governor in 1850, was defeated by Washington Hunt, but in 1852 was elected by a large majority. During his term a prohibition law was passed by the legislature and was vetoed by him as unconstitutional. The strong temperance sentiment prevalent at the time made his act very unpopular. During the term of his successor the vetoed law was again passed by the legislature, but was declared unconstitutional by the Court of Appeals. He was again elected governor in 1862 and made an unequivocal declaration in favor of the supremacy of the Constitution and the restoration of the Union, though he denied that the war was the unavoidable result of slavery, or that slavery should be abolished in order to restore the Union. In July 1863 serious riots broke out in New York, involving loss of life and destruction of property. These were caused by the draft-law which discriminated against New York City in the allotment of quotas. The governor's complaint to the President secured an investigation which resulted in procuring a correction of the errors of the enrolment. In 1868 he was nominated for the Presidency, but was defeated by Ulysses S. Grant, receiving 80 electoral votes to the 214 cast for Grant. Consult Croly, 'Seymour and Blair: Their Lives and Services' (New York 1868); Hartley, 'Horatio Seymour' (Utica 1886).

SEYMOUR, Lady Jane, queen of England: b. England, about 1509; d. Hampton, 24 Oct. 1537. She was the eldest child of Sir John Seymour and sister of Edward, Duke of Somerset and Protector of England. She became the third wife of Henry VIII (q.v.) and the mother of Edward VI (q.v.). She was the first maid of honor to Anne Boleyn, whom she supplanted in 1536, and favored the Protestant Reformation. Consult Hume, Martin, 'The Wives of Henry the Eighth and the Parts They Played in History' (Edinburgh 1905).

SEYMOUR, Thomas Day, American classical scholar: b. Hudson, Ohio, 1 April 1848; d. 31 Dec. 1907. He was graduated at the Western Reserve College in 1870 and later studied at the Universities of Leipzig and Berlin. He was professor of Greek at Western Reserve College in 1872-80; and chairman of the managing committee of the American School of Classical Studies, Athens, Greece, in 1887-1901. He edited the 'College Series' of Greek authors and was American coeditor of *Classical Reviews*. Author of 'Selected Odes of Pindar' (1882); 'Introduction to the Language and Verse of Homer' (1885); 'Introduction and

Vocabulary to School Odyssey, Eight Books' (1897); 'School Iliad, Six Books' (1889-1901), etc.

SEYMOUR, Thomas Hart, American legislator and diplomat: b. Hartford, Conn., 1808; d. there, 3 Sept. 1868. He was educated at a military academy at Middletown, Conn., became a lawyer at Hartford and was editor of *The Jeffersonian Democrat* in 1837. He was a member of Congress in 1843-45, served through the Mexican War, rising to the rank of colonel, and in 1850-53 was governor of Connecticut. He was Presidential elector in 1852; was United States Minister to Russia in 1853-57 and during the Civil War acted as leader of the Connecticut Peace Democrats, in which connection he lost much of his popularity. In 1862 the State senate voted that his portrait, with that of Isaac Toucey, should be removed from the chamber till the comptroller should be satisfied of his loyalty. In 1863 he was again a candidate for governor but was defeated by W. A. Buckingham after an exciting contest.

SEYMOUR, Truman, American soldier: b. Burlington, Vt., 25 Sept. 1824; d. Florence, Italy, 30 Oct. 1891. He was graduated from West Point in 1846, fought in the Mexican War and was brevetted captain. In 1850-53 he was assistant instructor at West Point, served in the Seminole War of 1856-58, and under Major Anderson at the defense of Fort Sumter in 1861, receiving the brevet of major in recognition of his services. He became chief of artillery in McCall's division of the Army of the Potomac in 1862 and was commissioned brigadier-general of volunteers. He was engaged in the Virginia and Maryland campaigns, was in command of a division at Malvern Hill, Manassas, South Mountain and Antietam, receiving rank of brevet colonel. As chief of staff to the commanding general of the Department of the South in 1863 he led a division on Folly Island, took part in the attack on Morris Island and commanded the unsuccessful assault of Fort Wagner on 18 July, in which he was severely wounded. He commanded a brigade in the battle of the Wilderness, was taken prisoner, and after his exchange in the following August was in command of a division in the Shenandoah Valley, and was engaged in the operations around Petersburg until the close of the war. He was present at Lee's surrender. He was brevetted major-general of volunteers and brigadier-general in the regular army, and in 1865 was mustered out of the volunteer service. He became major of artillery in 1866 and served in command of various forts until his retirement in 1876. After his retirement he resided in Europe, mostly in Florence.

SEYMOUR, Conn., town in New Haven County, near the junction of Bladen, Little and Naugatuck rivers, and on the New York, New Haven and Hartford Railroad, nine miles northwest of New Haven. Seymour is one of the oldest towns of Connecticut. The manufacturing of woolen goods was begun here the last of the 18th century. In 1803 Gen. David Humphreys (who was the first to bring merino sheep into the United States) bought the woolen mill and enlarged it to what was then called a large factory. In 1836 the place was incorporated under the name of Humphreysville, and in 1850 it was incorporated as a town under its

present name. The chief manufactures are woolen goods, mechanics' tools, agricultural implements, nails, pins, paper, submarine cables, fountain pens, bicycle parts and rubber. There are five churches, a high school, public graded schools, private schools and a public library. Pop. 4,786. Consult Sharpe, 'History of Seymour' (Seymour 1902).

SEYMOUR, Ind., city in Jackson County, on the Pittsburgh, Cincinnati, Chicago and Saint Louis, the Baltimore and Ohio Southwestern, the Chicago, Terre Haute and Southeastern, I. P. S. Traction Company and I. and I. Traction Railway Company, about 60 miles south of Indianapolis and 50 miles north of Louisville, Ky. It is an agricultural and stock-raising region and has considerable manufacturing interests. The chief industrial establishments are woolen mills, grain cradle and tool factory, large flour mills, hominy mill, chair factories, furniture factory, several commercial printing plants, harness factories, carriage factory, shirt factory, planing mills and other woodworking establishments, ice and cold storage plant, ice cream plant, bottling works and creamery. This being a division of the Baltimore and Ohio Southwestern, a great many railroad people are employed and live here. There are 11 churches, four ward public schools, Shields High School, Catholic and Lutheran parochial schools, two national banks, capital \$100,000 each, and one trust company, capital \$60,000. Pop. 8,013.

SFAX, sfāks, Tunis, a town on the east coast, on the Gulf of Gabes, opposite Kerkenna Island. It is strongly fortified and surrounded by gardens and villas. The European, Arab and French portions are the three distinct divisions of the town. The first modern, the second — in the central portion — walled and entered by two gates; the third, a camp. Sfax is an important seaport, with a considerable trade in dates, olive-oil, wool, fruits, sponges, grasses, etc.; cotton, woolen and silk goods are manufactured. A safe harbor and a railway connecting with the interior are modern features. The harbor is provided with a repair dock and slips for fitting and repairing the sponge and fishing vessels. Sfax was occupied in the 12th century by the Sicilians, and in the 16th century, for a brief period, by the Spaniards. One of the principal events of the conquest of Tunis by the French was the bombardment of the town in 1881. Pop. 45,000.

SFORZA, sfört'sā, a celebrated Italian house, which played an important part in the 15th and 16th centuries, gave six sovereigns to Milan and formed alliances with most of the princely houses of Europe. The founder of the house was a peasant of Cotignola in Romagna, GIACOMUZZO (Giacomo or Jacopo Muzio). ATTENDOLO: b. Cotignola, in the Romagna, 10 June 1369; d. 4 Jan. 1424, whose skill and courage made him one of the most powerful condottieri of Italy. His surname of Sforza (the forcer), which vouches for his great strength, he is said to have received from Alberigo Barbiano, the true founder of the condottiere mode of warfare in Italy. He served in the wars in the papal states, in Tuscany and in Naples, and died as Grandconstable of Naples. His son FRANCESCO: b. 25 July 1401; d. Milan, 8 March 1466, received the command of

the Milanese forces in the war against Venice. In 1447 he laid claim to the states of Milan in virtue of his wife, although she was only the natural daughter of the last duke, and to enforce his claim concluded a treaty with Venice, and advanced against Milan. He laid siege to the city in 1449, and on 3 March 1450 it was forced by famine to surrender. His son **GALEAZZO MARIA**: b. 24 Jan. 1444; d. 26 Dec. 1476, a barbarian and a voluptuary, was murdered by conspirators. The son of Galeazzo, **GIOVANNI GALEAZZO**: b. 1468; d. 1494, never actually ruled. Till 1480 he was subject to the guardianship of his mother and her minister, Checco Simonetta. The latter was then beheaded by his uncle Lodovico, surnamed the Moor, in 1481. Lodovico then assumed the government himself and kept his nephew virtually a prisoner in the castle of Pavia. At a subsequent period he joined the league against France, and was on that account deposed by Louis XII (1500). He was taken to France where he died. His son **MASSIMILIANO**: b. 1491; d. 1530, once more drove the French from his territories by the aid of the Swiss, but in consequence of the battle of Marignano was obliged to cede his dominions to Francis I (1515) in consideration of a pension. The remainder of his life was spent in France. Francis was afterward driven from Italy by the Emperor Charles V, who invested **FRANCESCO**: b. 1492; d. 24 Oct. 1535, brother of Maximilian, with the duchy of Milan in 1522. On the death of Francesco in 1535 Charles V conferred the duchy on his son Philip II, king of Spain. Consult *Ady, C. M., 'History of Milan under the Sforza' (New York 1907); Corio, 'Historia di Milane' (1565); Verri, 'Storia di Milane' (1851); Hallam, 'View of the State of Europe during the Middle Ages' (1818); Magenta, 'Gli Visconti e gli Sforza' (Milan 1883).*

SGAMBATI, zḡam-bā'tē, **Giovanni**, Italian musician: b. Rome, 28 May 1843; d. 14 Dec. 1914. He studied at Trevi, Umbria, and in 1860 removed to Rome. There he gained the friendship of Liszt, whose teaching and influence were of inestimable benefit to him. He became known as a conductor, composer and pianist, and as an interpreter of German music in Italy. He was professor of pianoforte at the Academy of Saint Cecilia from 1877; and in 1897 he founded the Nuova Società Musicale Romanà. His pianoforte pieces won wide success and he also composed a requiem mass, three symphonies, several concertos, overtures and organ pieces.

SGANARELLE, zḡa'na'rēl', a comic character in ancient comedies, frequently used by Molière, with whose plays he is generally associated. He is introduced by Molière in 'Sganarelle, ou le cocu imaginaire' (1660). He appears also in 'Don Juan, ou le festin de Pierre' (he is Leporello in the opera 'Don Giovanni'); and in 'L'Amour d' médecin'; 'Le médecin malagré lui'; 'Le mariage forcé,' and others. The character as handled by Molière is the source of many popular proverbs.

SGRAFFITO (sgrāf-fē'tō) **DECORATION**, that which is produced by means of scoring or scratching on a comparatively soft surface. It is like engraving in all respects except in the relative hardness of the material

and the delicacy of the work. There is only one peculiarity in it which is different in nature from the effect produced by engraving, and that is the producing of color effects by scratching through an outer surface so as to show an inner surface of a different hue or tint. Even in this respect it is like a very delicate art of incision, namely, the Japanese method of cutting through different layers of colored lacquer so as to produce decorative patterns. It is also in this respect like the art of cameo-cutting when applied to onyx in layers of black and white, or a similar stratified material.

Sgraffito decoration, in the usual sense, is of two kinds: first, that which is applied to plaster surfaces, as of the outer faces of walls; and, secondly, to clay surfaces, as where an earthen pot is scored with a hard point before it is fired. In both of these departments sgraffito decoration is one of the earliest methods applied; and in pottery we have in our museums pieces of prehistoric and primitive work of great interest, while also the art seems one never wholly abandoned when pottery is made cheaply and quickly by people who care for decorative effect. The sgraffito decoration of plaster walls is, however, limited in application to a few epochs of European history. It has never been out of use in Italy since the Middle Ages, and occasionally a new building, even of some pretensions, is adorned in this way, or a monument of the past is carefully restored, with its sgraffito decoration repaired and completed. In the northern lands of Europe the severity of the weather is a partial check on the employment of the art; but the main reason for its neglect is the modern desire for smoothness, finish and completeness of all sorts, with which the sgraffito process may be thought to be inconsistent. It is clear that a house faced with brown plaster which is deeply scored to show line of black and white plaster from below will not meet the requirements of a community respecting nothing which has not the look of expense and deliberation. The effects, however, are very spirited and artistic, and it is a pity that the process is not used for inexpensive building. Consult *Opitz, 'Sgraffito' (1891).*

SHABATZ, shā'bāts, **SHABATS**, or **SABAC**, Jugo-Slavia, town, capital of the Drina department, on the river Save, 35 miles west of Belgrade. It has a castle dating from 1470, is the seat of a bishop, of the district prefecture and of a tribunal. The town is the commercial centre of the surrounding country, and exports honey, prunes, grain, cattle and hogs. It suffered considerably as the scene of active fighting in the European War. Pop. 12,072.

SHABUOTH, a Jewish feast, known also as the Festival of the Weeks; the most joyous of all the ancient Hebrew holidays. It was originally called the Feast of the Barley.

SHACKLETON, shāk'l-tōn, **SIR Ernest Henry**, British naval officer and Antarctic explorer: b. Kilkee, Ireland, 15 Feb. 1874. He was educated at Dulwich College, served in the merchant marine and was a lieutenant in the Royal Navy Reserve. He was third lieutenant under R. F. Scott in the National Antarctic Expedition in 1901-04, and with Scott reached lat.

82° 17', the farthest point south then touched. He was secretary and treasurer of the Royal Scottish Geographical Society in 1903-06. In 1907-09 he commanded the British Antarctic Expedition, and succeeded in reaching lat. 88° 23' S., 9 Jan. 1909, establishing a new record. He also ascended Mount Erebus, 13,120 feet high, and reached the south magnetic pole 16 Jan. 1909, determining its position as lat. 72° 25', long. 154° E. He headed a third expedition in 1914-16, crossing Antarctic from Coat's Land to Mac Murdo Sound and making valuable geologic and scientific surveys. He was awarded the special gold medal of the Royal Geographical Society, the King's Polar medal with two bars, and gold medals from the Royal Scottish Geographical Society as well as from the geographical societies of Denmark, Belgium, France, Antwerp, Italy, America, Paris and Russia. He was knighted in 1909 and is an officer of the Legion of Honor. Author of 'Heart of the Antarctic' (1909); 'Diary of a Troopship.'

SHACKLETON, Robert, American writer: b. Wisconsin, 26 Dec. 1860. He studied law in Michigan, was admitted to the bar in Ohio, followed journalism in New York for five years, was in Philadelphia as associate editor of *The Saturday Evening Post* for two years. He is the author of 'Toomey and Others' (1900); 'Many Waters' (1902); 'The Great Adventurer' (1904); 'The Quest of the Colonial' (with Elizabeth Shackleton, 1907); 'Adventures in Home-Making' (1910); 'A Living Without a Boss' (1911); 'Unvisited Places of Old Europe' (1913); 'The Charm of the Antique' (with Elizabeth Shackleton, 1915); 'Four on a Tour in England' (1915); 'Life of Russell H. Conwell' (1916); 'The Book of Boston' (1916).

SHAD, the popular name of three recognized anadronous fishes of the genus *Clupea*, viz., the Allis, or European shad; the American shad, *clupea sapidissima*; and the Twaite shad, *clupea finta*. To these should be added a fourth, recently discovered to be distinct, to the Gulf States. This genus is closely allied to the alewives (*Pamolobus*), from which it is distinguished by the very deep head, particularly the cheeks, and by having the upper jaw compressed and grooved to receive the tip of the lower. The American Atlantic shad is the largest of the herrings found in this country, the female exceeding the male and generally weighing at the spawning age three to six pounds, though larger ones are taken. On the Pacific Coast, where the shad has been introduced and established, it reaches a greater weight. The body is deep and compressed, especially on the belly, where the scales and their supporting bones form a series of serrations; the scales are large and very easily detached; the mouth toothless and the gill-rakers long and numerous. The numerous slender, pin-like bones, which are such an annoyance at the table, are chiefly several series of intermuscular bones which support the muscle segments above the ribs. There is a narrow lateral strip of dark muscle.

The northern limit of the shad's range is the Gulf of Saint Lawrence, south of which it enters all of the rivers of the Atlantic seaboard unless prevented by some obstruction. Intro-

duced into the Sacramento River by the California and United States fish commissions in 1871-80, it has now become abundant on the Pacific Coast from Monterey Bay to Alaska. Concerning the habits of the shad during the greater part of its existence in the sea, very little is definitely known. Apparently, from the fact that they are taken frequently with mackerel and other fishes near the coasts, they do not depart very far from the shores. Their structure indicates that they swim near the surface, strain through their gill-rakers the water taken in by the mouth, and retain the minute life which it contains. This food appears, from what few stomach examinations have been made, to consist chiefly of minute crustaceans. Their movements are controlled largely by the temperature of the water and, although the annual migration from the sea to the rivers is solely for the purpose of reproduction, it takes place when the temperature of the water lies between 56° and 66°, and is hastened or retarded accordingly by warm or cold seasons. The movement of the schools begins in November and ends in March in the Saint John's River and progresses regularly from south, northward, as the season advances, the chief runs in the Potomac occurring in April, in the Delaware in April and May and in the Kennebec in May and June. During the earlier weeks of the migration males predominate, during the later, females. The eggs may be deposited anywhere above brackish water, at the mouths of creeks or high up the rivers. No nest is formed or other care given the eggs; the spawn and milt are simply ejected in intermingling streams as the male and female fish swim side by side about the time of sunset. The fertilized eggs are about one-eighth of an inch in diameter with a water space beneath the egg membrane and, being heavy, sink to the bottom. From 30,000 to 100,000 eggs are taken artificially from each female, but the natural yield is much greater. After spawning, the fish which are lean and starved begin to feed and move sea-ward. The young shad remain in the rivers much longer and do not finally enter the bays and coastal waters until the temperature of the river water approaches 40° when, in November, they are about three inches long. They remain in the sea for three or four years until mature, though a few immature ones often enter the rivers in the spring with herrings or shad, and they have been found on several occasions in shallow bays along the coast. Besides man, the shad has many enemies, and the destruction of the eggs and young by predaceous fishes, and especially by eels, is enormous. Because of this fact and the added one that shad can be caught only before and during the spawning season, and for various other reasons, the shad fisheries had greatly declined and in some places had even been abandoned during the seventies.

To remedy this the United States Fish Commission took up the problem of the artificial propagation of shad and succeeded so well that the fisheries have not only been saved, but greatly extended and at the present time are dependent on this means of maintaining the abundance of this fish. The chief advantage of artificial over natural propagation lies in the much larger percentage of eggs fertilized and

hatched. In its perfect state the method is very simple but exact. The spawn-takers enter the boats as the nets are drawn and select and strip with great precision the ripe males and females, the milt being squirted over a layer of eggs in the bottom of a moist pan, after which a small quantity of water is added and the whole gently agitated. The surplus milt is then washed away and eggs carefully washed and cleaned. As the eggs are heavier than the water they are now hatched in a closed McDonald or siphon jar, to which a stream of fresh water is admitted through a glass tube running to the bottom, and the overflow drawn off at the top, thus constantly moving the eggs. They begin to hatch in about a week, though the time varies with the temperature, and as the young fry and nearly hatched eggs rise to the surface they are drawn off automatically at the outlet into larger vessels. With careful attention to details the fry are distributed to the various creeks and rivers a few days after hatching, in some cases the special cars devised for carrying young fish being employed for their transportation. They may, however, be readily reared in ponds, and many have been thus kept for months or even a year before being liberated. The shad-hatching work at one time reached enormous proportions. In 1900, for example, the United States Fish Commission hatched and distributed 241,056,000 fry; but in the fiscal year 1916-17 the distribution fell to 77,946,000 fry.

The great estimation in which the shad is held as a food-fish led to the development of this fishery so that it is exceeded in value only by that of the cod and salmon. The fisheries attained their greatest extent in Delaware Bay and river, Chesapeake Bay and tributaries and the North Carolina sounds. By 1916 the supply had become imperiled by unrestricted fishing and by obstructions and pollutions. In the Hudson, formerly one of the leading shad streams, the catch decreased from 588,898 in number in 1896 to 9,287 in 1916; in the Chesapeake region, from over 7,000,000 pounds in 1890 and 3,252,000 in 1909, to 1,454,535 in 1915; in Virginia, from 11,500,000 pounds in 1897 to 4,714,124 in 1915. In 1915 these fisheries were operated on a capital of \$1,528,824, and the value of their products was \$1,155,670. With the exception of a few pickled and salted the entire catch of shad is consumed fresh. In the sounds, bays and estuaries many are taken in pound nets and weirs, but in the rivers above their mouths gill nets and seines are the chief means of capture. Some of the great seines in use on the Potomac and Delaware rivers are more than a mile in length and are hauled by means of donkey engines.

Two species of shad are found in Europe, the common or allis shad (*Alosa vulgaris*) and the twaite shad (*A. finta*). The common shad inhabits the sea near the mouths of large rivers, and in the spring ascends them for the purpose of depositing its spawn in the shallow water about their sources. The young fry remain for a season in the waters which gave them birth, but on the approach of cold weather descend the rivers and take refuge in the ocean. The old ones likewise return, and at this time are emaciated and unfit for food. Its color is a dark blue above, with brown and greenish lustres, the under parts being white. The twaite

shad is about a half less than the common species, and weighs on an average about two pounds.

SHAD-WAITER. See WHITEFISHES.

SHADDOCK, a small tree (*Citrus decumana*) of the order Rutaceæ. It is a native of the Malay Archipelago, whence it has been introduced into India, the West Indies, Florida, California and other warm climates for its fruits. It is a small tree about 25 feet tall, with large ovate leaves, large white flowers and light yellow or pink fruits, with sweet or acid pale yellow or reddish pulp, arranged in sections like those of the orange. In some horticultural varieties the fruits are more than six inches in diameter and weigh more than 10 pounds. The true shaddocks are pear-shaped and are seldom found in the northern markets, since the round fruited kinds or "pomelos" are in America considered more valuable for shipping. The name "grape-fruit" is often applied to the shaddock because it is produced in clusters somewhat resembling grapes. Other popular names are forbidden fruit, fruit of paradise, pumelo, pompelos and variations of spelling. The tree is somewhat larger than its relative, the orange, and is planted about 30 feet apart. It is found to be most satisfactory when budded upon its own stock, or that of the sour or sweet orange, the first being preferred by many growers. It is considered more tender than the orange and in the United States is grown only in the lower part of the Florida Peninsula and warmer California. The cultivation, fertilization and management are practically the same with the above exceptions to those of the orange and lemon (qq.v.).

SHADOOF, an ancient Egyptian contrivance for raising water. It is extensively in use in the East for drawing water for irrigation purposes, and its prototype is found in use in the South in the United States, where it is employed to draw water from the open "surface" wells. The machine consists of a cross-bar on two uprights; suspended on this horizontal bar is a long rod or branch of a tree, so fixed as to work as on a fulcrum, the long end or lever pointing upward and over the water, usually a river or stream, and the short end behind the bar and nearest the ground. On the short end is affixed a weight of rock or dried mud, to act as a counterpoise to the long end. From the end of the long portion a bucket is suspended. When not in use the shadoof naturally rests with the short weighted end next to the ground and the long end, with dependent bucket, in the air. When it is desired to draw water the bucket is pulled down (by a rope attached to the long end) and is dipped under the water; on account of the weight at

the other end it is now easy to tip the shadoof, again bringing the bucket into the air where it can be poured into any object on the bank desired—often a hole, from which a runnel conveys the water to irrigation ditches. Shadoofs are often made two or more, side by side, or a succession of them along the bank to be used at different stages of the water.

SHADOW, the darkness caused by the interposition of an opaque substance between a luminous point or body and the place upon which the shadow is thrown. When the substance that casts the shadow is in open space, the form of the shadow is that of a section of the substance made at right angles to the direction of the ray of light. When the body casting the shadow is larger than that which emits the light the shadow goes on constantly increasing in diameter the further it goes; when it is of the same size with the latter, the shadow is unlimited in length, but always remains of the same diameter; and when it is smaller the shadow gradually diminishes to a point, where it terminates. The intensity of the shadow depends upon the degree of transparency, translucency or opaqueness possessed by the substance interposed between the point of light and the place on which a shadow is cast.

SHADOW PLAY, or **SHADOW PANTOMIME**, a theatrical performance acted by puppets or persons, whose shadows are thrown upon a screen by means of a light placed back of the performers. The idea is of great antiquity and is thought to have originated in China. It has long been a favored entertainment in Japan, the Malay Archipelago, throughout southern and western Asia, Egypt and eastern Europe. It was introduced in France in the 18th century, and like the puppet shows and pantomimes, became popular as an entertainment for children. It is revived from time to time, usually in vaudeville or cabaret acts.

SHADWELL, Charles Lancelot, English lawyer and author: b. London, England, 16 Dec. 1840. He was educated at Christ Church, Oxford, was called to the bar of Lincoln's Inn in 1872. From 1905 to 1914 he was provost of Oriel College and is a late Fellow of Winchester College, and has published 'The Laudian Statutes' (1888); 'History of Oriel College' (1891); 'The Earthly Paradise' (1899); 'Registrum Oriense' (2 vols., 1893-1902); 'The Purgatory of Dante Translated in English Verse' (1892); 'University and College Estates Acts' (1898). He edited Pater's 'Greek Studies' (1895); 'Miscellaneous Studies' (1895); and 'Gaston Latour' (1896).

SHADWELL, Thomas, English dramatist and poet laureate: b. Stanton Hall, Norfolk, about 1640; d. London, 19 Nov. 1692. He was educated at Cambridge and subsequently studied law. His comedy, 'The Sullen Lovers' (1668), was successful and he thereafter devoted himself to literature. He wrote 17 plays, the most of them modeled on the style of Ben Jonson, which caricatured with genuine humor, though somewhat coarsely, various eccentricities in the manners of the day. After the Revolution he became, in 1688, poet laureate and royal historiographer, succeeding Dryden and thereby incurring the enmity of that poet, who made him the hero of his clever satire, 'MacFlecknoe.'

His death was supposed to be due to an overdose of opium. His poetry was of little merit, but his dramatic pieces, though of only temporary reputation, were much lauded in their day. They include 'The Virtuoso' (1676); 'Lancashire Witches' (1682); 'Volunteers, or the Stock-jobbers' (1693), etc. His collected 'Works' were published in four volumes (1720). Consult Gray, W. F., 'Poets Laureate of England: Their History and their Odes' (London 1914), and Ward, A. W., 'History of English Dramatic Literature' (3 vols., New York 1899).

SHAFFNER, Taliaferro Preston, American inventor: b. Smithfield, Va., 1818; d. Troy, N. Y., 11 Dec. 1881. He studied law and was admitted to the bar, but practised little, his attention being largely absorbed by inventions. In the early days of the telegraph he was an associate of Samuel F. B. Morse. He built the line from Louisville, Ky., to New Orleans and that from Saint Louis to Jefferson City in 1851, and held office in various telegraph companies. He projected a North Atlantic cable that should touch Labrador, Greenland and Iceland, and secured a number of patents for the use of high explosives in blasting. During the Dano-Prussian War of 1861 he was in the service of Denmark. He published the 'Telegraph Companion: devoted to the Science and Art of the Morse American Telegraph' (1855); 'The Telegraph Manual' (1859); 'The Secession War in America' (1862); 'History of America' (1863); 'Odd Fellowship' (1875).

SHAFROTH, shăf'rôth, John Franklin, American lawyer, governor and senator: b. Fayette, Mo., 9 June 1854. He was graduated at the University of Michigan in 1875 and was admitted to the bar in 1876. He engaged in practice in Fayette until 1879, then removed to Denver, Colo., where he has since practised. He served in Congress in 1895-1905, was governor of Colorado in 1909-13, and in 1913-19 was United States senator.

SHAFTER, shăf'ter, William Rufus, American military officer: b. Galesburg, Mich., 16 Oct. 1835; d. near Bakersfield, Cal., 12 Nov. 1906. At first a farmer, on the outbreak of the Civil War he entered the Seventh Michigan Infantry. He participated in the battles of Fair Oaks, Savage Station, Glendale and Malvern Hill; was appointed major 5 Sept. 1862; was taken prisoner at Thompson's Station, Tenn., in March 1863 and exchanged in May of the same year; was made lieutenant-colonel 5 June 1863 and became colonel of the 17th United States colored troops 19 April 1864; brevet brigadier-general of volunteers for gallant and meritorious services during the war; and was mustered out of the volunteer service 2 Nov. 1865. He entered the regular army and became lieutenant-colonel of the 41st Infantry 26 Jan. 1867; assigned to the 24th Infantry 14 April 1869; colonel of First Infantry 4 March 1879; and brigadier-general 3 May 1897. On the breaking out of the Spanish-American War he was given command of the army mobilized for the invasion of Cuba; his first decisive move was the landing of 16,000 men at Daiquiri, Cuba, on 21 June 1898, in about 12 hours without an accident. He conducted the military operations resulting in the surrender of Santiago de Cuba.

After the war he commanded the department of California and Columbia in 1899-1901, and was retired 3 June 1901. Consult the biography by Charles A. Weissert (1916).

SHAFTESBURY, shäfts'bū-rī, **Anthony Ashley Cooper**, 1st EARL OF, English statesman: b. Wimborne Saint Giles, Dorsetshire, 22 July 1621; d. Amsterdam, 21 Jan. 1683. He entered Exeter College, Oxford, whence he removed to Lincoln's Inn, with a view to the study of law; but was chosen representative for Tewkesbury in 1640. At the commencement of the civil war he sided with the king's party, though he appeared to deem mutual concession necessary. Finding himself in consequence of this opinion distrusted by the court he went over to the Parliament, from which he received the command of the parliamentary forces in Dorsetshire. When Cromwell turned out the Long Parliament, Sir Anthony was one of the members of the convention which succeeded. He was, nevertheless, a subscriber to the protestation which charged the Protector with arbitrary government, though this fact did not prevent him from becoming one of his privy council. After the deposition of Richard Cromwell he was privately engaged in a plan for the restoration of Charles II, which he subsequently aided with all his influence. He was one of the 12 members of the convention of 1660 who carried the invitation to the king, and was soon after made a privy councilor and a commissioner for the trial of the regicides. In 1661 he was raised to the peerage by the title of Baron Ashley, and appointed chancellor of the exchequer and a lord of the treasury. Yet he gave his strenuous opposition to two of the leading measures favored by the Crown, the Corporation Act in 1661 and the Act of Uniformity in 1662. Afterward his conduct changed and he was one of the members of the obnoxious Cabal (q.v.). He supported the Dutch war and issued illegal writs for the election of members of Parliament during a recess, and in 1673 supported the Test Act. In 1672 he was created Earl of Shaftesbury and Lord High Chancellor. His conduct on the bench was able and impartial. He had not, however, been a whole year in office when the seals were taken from him, probably through the influence of the Duke of York; and from that moment he became one of the most powerful leaders of the opposition. He made use of the Popish plot to force out the Earl of Danby's administration (1678) and produce the formation of a new one, in which he was himself made president of the council April 1679. Amid many violent party proceedings which followed the Habeas Corpus Act was passed. He remained in the administration only until October. In his hostility to the Duke of York, Shaftesbury is now supposed to have entered into connection with the Duke of Monmouth, with the view of supporting his claims to the Crown, a circumstance which gave rise to Dryden's satire of 'Absalom and Achitophel.' In consequence of this suspected design Shaftesbury was once more committed to the Tower and tried for high treason; but the grand jury before whom the bill of indictment was laid ignored it. Not long after this acquittal the earl withdrew to Holland, where he died. He was highly accomplished and easily the greatest politician and governor of parties

in his time in England. Consult the biographies by W. D. Christie (London 1871) and H. D. Traill (ib. 1886); also Macaulay's 'History' (1848-55).

SHAFTESBURY, **Anthony Ashley Cooper**, 3d EARL OF, English moral philosopher: b. London, 26 Feb. 1671; d. Naples, 15 Feb. 1713. He was grandson of the preceding. After travel in Germany, France and Italy, he became (1695) the representative in Parliament of Poole, in Dorsetshire, and distinguished himself while in Parliament by his support of measures favorable to public liberty. In 1698 he gave up his seat, and visiting Holland in the assumed character of a student of physic, he prosecuted his studies, and became intimately acquainted with Bayle, Le Clerc and other literary men. In 1709 he published an 'Essay on the Freedom of Wit and Humor,' an 'Inquiry Concerning Virtue or Merit,' and 'The Moral-ist, a Philosophical Rhapsody,' being an eloquent defense of the doctrine of a Deity and providence. His 'Sensus Communis,' and his 'Soliloquy, or Advice to an Author,' followed in 1710. At the time of his death he was engaged in a work on the 'Arts of Design.' His works were collected and published together, under the title of 'Characteristics of Men, Manners, Opinions, and Times' (1711; rev. ed. 1714). A new edition by Hatch began to appear in 1870, but was never finished. As a writer he is remarkable for the elegance but also for the excessive artificiality of his style. In all his works Lord Shaftesbury appears a zealous advocate for liberty, and a firm believer in the fundamental doctrines of natural religion; but, although he professed a respect for Christianity, he was doubtless sceptical in regard to revelation. (See CHARACT. ISTICS). Consult the works by Spicker (1872); von Gizycki (1876); Fowler, 'Shaftesbury and Hutcheson' (1882); also Rand, 'Unpublished Letters and Philosophical Regimen of the 3d Earl of Shaftesbury' (1900); Leslie Stephen 'Essays on Free Thinking and Plain Speaking' (new ed., New York 1905).

SHAFTESBURY, **Anthony Ashley Cooper**, 7th EARL OF, English philanthropist: b. London, 28 April 1801; d. Folkestone, Kent, 1 Oct. 1885. He was educated at Harrow and Oxford, and sat in the House of Commons during most of the period from 1826 to 1851, as member successively for Woodstock, Dorchester, Dorsetshire and Bath, but in the latter year succeeded to the peerage. He supported the administrations of Liverpool and Canning, and in 1828 he was appointed a commissioner of the board of control. Six years later he became a lord of the admiralty under Sir Robert Peel. From 1828, when he was appointed a member of a committee of inquiry into the treatment of lunatics, he constantly strove to improve the lunacy laws and administration; and it is largely due to his efforts that most of the worst abuses were removed. But his name must ever be chiefly associated with his noble and successful efforts to improve the condition of factory workers. About 1833 he first proposed the limitation of their working-day to 10 hours, and in spite of opposition his proposal became law in 1847. In 1842 an act was passed under

his direction for the improvement of the condition of colliery workers.

Though a Conservative, he supported the repeal of the corn-laws. For 39 years he acted as chairman of the Ragged School Union, and he was also identified with various movements for securing better house accommodation for the working classes. He was president of the Bible Society, of the Pastoral Aid Society, of the Protestant Alliance and of other religious organizations. He was very popular with the masses of the population. He was an ardent evangelical in religious matters, and opposed to rationalistic beliefs and ritualistic practices. He published a volume of 'Speeches' (1868). Consult Hodder, Edwin, 'Life and Work of the Earl of Shaftesbury' (3 vols., London 1886); Walpole, Sir Spencer, 'Studies in Biography' (New York 1907).

SHAG, a cormorant, especially the *Phalacrocorax corbo*.

SHAGREEN, a kind of grained leather, of a close and solid substance, used for forming covers for cases, etc., which easily receives different colors. It is prepared in the East from the skins of wild asses, horses and camels. The most common color is sea-green (given by means of copper-filings and a solution of sal-ammoniac); but blue, red, black and other colors are also given it. Shagreen is also made of the skins of the sea-otter, seal, shark, etc. Consult Watt, A., 'Leather Manufacture' (London 1906).

SHAH, the title given by western writers to the sovereign of Persia; in his own country he is known by the compound title Padishah. It is also used in other countries of central and southern Asia, and signifies a sovereign prince or king.

SHAH ALUM (Alam, Alem) II, emperor of Delhi: b. 1728; d. 1806. He was the last of the Mogul emperors to exercise even a nominal independence and ascended the throne in 1759. For 12 years he was exiled and he finally, in the endeavor to strengthen his authority over his empire, sought British friendship and granted to them Bengal, Bahar and Oressa in exchange for the city and district of Allahabad. He put himself under the power of the Mahrattas in 1771, but in 1788 Delhi was seized by the Mohammedan rebel, Ghulam Kadir, who put out the emperor's eyes. From 1803-06, under the protection of Lord Lake, who had defeated the Mahrattas, Shah Alum enjoyed a period of comparative affluence, thus peacefully ending his long and wretched reign.

SHAH JEHAN, jē-hān, or **SHAH JAHAN**, Mogul emperor of Delhi: b. about 1592; d. 1666. He was fifth of the dynasty and in his youth was repeatedly in revolt against his father, Johangir, upon whose death in 1627 he succeeded to the throne. His reign saw the Mogul empire at the height of its wealth and glory. He destroyed the kingdom of Ahmadnagar in 1636; and while he lost Kandahar to the Persians in 1653, he waged successful war against the Deccan princes in 1655. In 1658, when ill, he was seized by his son, Aurang-Zeb, and imprisoned the remainder of his life. His reign was distinguished further for its remarkable achievements in architecture. He built the

Taj Mahal at Agra as a tomb for his wife, Mumtaz Mahal; the pearl mosque at Agra; the palace and great mosque at Delhi, which city he founded; and also built the celebrated Peacock Throne, the value of which has been estimated at \$30,000,000.

SHAH NAMEH, nā'mē ("Book of the Kings"). This Persian national epic is one of the masterworks in the world's literature. It is by Firdūsi, the greatest of the Persian poets, who spent 30 years of his life in composing it. It consists of some 60,000 rhymed couplets and is a fanciful chronicle of Irān, for to call it a history would be misleading. It is full of imaginative conceits, many of them wild, extravagant and without any basis of fact. However, what Firdūsi (whose real name was a long and quite different one, Firdūsi being an honorary appellation) sets out to do is to trace the varying fortunes of Persia, from its remotest and wholly legendary beginnings to his own time, almost. And this task, viewing him solely as a poet, he undoubtedly accomplished admirably. When he undertook it he was living at the court of the great Sultan Mahmoud Ghazni, about A.D. 1000. Poetically the legendary lore dispensed by the author is quite attractive and stirring, and his account of the glorious reign of King Jamsheed—the golden age of Persian tradition—is eloquent and enticing. So, too, is his story of the doings of the likewise mythical Khayanian dynasty and down to the days of Zerdusht (Zoroaster), where he first begins to touch on historical fact, to the first downfall and conquest of Persia under Alexander the Great, and to the even worse fate overtaking it when the Arabs destroyed the throne of the mighty Sassanides, and the national creed of the country, and forced Islam upon the Persians. It is of interest to note that the entrancing tale of the legendary Persian hero, Rustem, as given by Firdūsi in his poem, is in most respects a striking parallel to that of the Germanic hero, Siegfried, the Norse Sigurd. Very wide latitude must be granted the poet in unwinding his long tale, and his departures from historic truths; his anachronisms are frequently glaring. These however, have all been more than condoned by his Persian audiences, as they are owing for the most part to Firdūsi's intense nationalism. Besides, the Persian of every age has harbored a deep-rooted disdain for plain, sober fact. And looking at the Shah Nameh purely as a work of art, as a creation of the poet's fancy, this epic lay must be given a very high place in world literature. There is, to mention its chief merits, a sustained fire of diction, an untiring play of imagery and brilliant metaphor, a sweet euphony and sonorousness, a wealth of realistic detail, a daring fancy and an unflagging power of description which, take it all in all, are perhaps unrivaled in any other tongue. And these undeniable traits of Firdūsi's epos far outweigh its defects. Throughout he does not even seriously attempt to be a real historian, to apportion justly praise and blame, to tell the truth. But he is and remains from first to last a poet, who "in a golden clime was born, with golden stars above." And as the Persian loves to revel in poetic fancy, it is small wonder that the Shah Nameh has become one of his dearest treasures, all educated Persians even to-day being able to

recite whole pages of the poem. As to translations, abridgments, etc., the best translation of the Shah Nameh is a complete French one, done by Jules Mohl under the title of 'Le Livre des Rois' (7 vols., Paris 1876-78); an excellent abridgment of it in English is by James Atkinson, 'Shah Nameh' (reprinted in the Chandos Series, New York 1886); there are also spirited versified selections from it in Robinson's 'Persian Poetry for English Readers' (Glasgow 1883). Consult also Browne 'A Literary History of Persia' (New York 1902-06).

WOLF VON SCHIERBRAND.

SHAHAN, shā'ān, Thomas Joseph, American Roman Catholic bishop and educator: b. Manchester, N. H., 11 Sept. 1857. He was educated at the Montreal College; the American College, Rome; the Roman Seminary, and at the University of Berlin. He was ordained priest in 1882; was chancellor and secretary of the diocese of Hartford in 1883-88; became professor of church history and patrology at the Catholic University of America in 1891, and since 1909 has been rector there. He was created domestic prelate of the Pontifical Court, Rome, with rank of monsignor, in 1909, and was consecrated titular bishop of Germanicopolis 15 Nov. 1914. He is a contributor to the leading Roman Catholic magazines; edited the *Catholic University Bulletin* in 1895-1909; and was associate editor of the 'Catholic Encyclopedia' in 1905-15. Author of 'The Blessed Virgin in the Catacombs' (1892); 'The Beginnings of Christianity' (1903); 'Saint Patrick in History' (1905), etc.

SHAHAPTIAN (shā-hāp'te-an) **INDIANS**, a linguistic stock of North American Indians, the name of which is adapted from the Kootenay name of the Nez Percés, one of its principal tribes. The divisions of the stock occupied a large section of the country along the Columbia and its tributaries in what is now northeastern Oregon, southeastern Washington, and southwestern Idaho, extending from about long. 114° 30' to 121°, and between lat. 44° and 46°. Their western boundary was the Cascade Mountains; their westernmost bands, the Klikitat on the north, the Tygh and Warm Springs on the south, enveloping for a short distance the Chinookan territory along the Columbia which extended to the Dalles. Shahaptian tribes extended along the tributaries of the Columbia for a considerable distance, especially along Snake River, their eastern boundary being interrupted by the Bitter-root Mountains. The customs and habits of the tribes composing the stock were fairly homogeneous, the family organization was loose, and the clan system did not prevail. They subsisted chiefly on salmon and on roots and berries, and after the introduction of the horse did more or less hunting. Agriculture was not engaged in, and the villages were of temporary character owing to the necessity of frequently shifting residence in search of food. With the exception of the outbreak of the Nez Percés under Chief Joseph in 1877, due to the failure of the government to fulfil its treaty obligations with the Indians, the Shahaptian tribes have been generally peaceful. The principal tribes or bands of the stock, with their present location,

are Yakima, 2,311 under Yakima agency, Washington, and perhaps 300 not under an agent; Nez Percé (Chopunnish), 1,567 under Nez Percé agency, Idaho, and 126 under Colville agency, Washington, total 1,693; Klikitat, about 165 under Yakima agency, Washington; Palloos, unknown number under same agency; Tenaino, 70 under Warm Springs agency, Oregon; Tygh, about 430 under same agency; Umatilla, 184 under Umatilla agency, Oregon; Wallawalla, 525 under same agency; Tukspush or John Day Indians, about 60 under Warm Springs agency.

SHĀHJEHĀNPUR, shā-jē-hān'poor, India, chief town and administrative headquarters of a district, 100 miles northwest of Lucknow. Some fine mosques and the ruins of an ancient castle are its most interesting architectural features. Its chief industries are agriculture, sugar refining, and distilling, and the export trade consists of sugar, pulses and cereals. The town was founded in 1647 by the Mogul emperor, whose name it bears. In the mutiny of 1857-58 it was one of the active seats of the rebellion. Pop. 71,778.

SHĀHRĀSTĀNĪ, shā'ras-tā'nē (ABŪ'L-FATH MOHAMMED IBN 'ADD AL KARĪM AL SHARĀSTĀNĪ), Arabian theologian: b. Sharastan, Korasan, 1071?-1086?; d. there 1153. He studied at Jurjāniyah and Nishapur, devoting himself especially to Ash'arite theology. In 1116 he went on pilgrimage, and returning remained three years in Bagdad, reaching home in 1120. His chief work is the 'Kitāb ul Milal wan-Nihāl,' a painstaking and well-arranged study of the religious sects and philosophical schools known to him. The work first discusses the five races of the world and the basis of the religion and theories of each. His account of the many Mohammedan sects is particularly full and valuable; and he deals also with Christianity, Judaism, the pre-Islamic Arabs, the Greek philosophers and with heathen beliefs. The work was published by Cureton, W., 'Book of Religious and Philosophical Sects' (London, 2 vols., 1846); and by Haarbrucker, T., (Halle, 2 vols., 1850-51).

SHAIRP, shārp, John Campbell, Scottish poet and miscellaneous writer: b. Houston, West Lothian, 30 July 1819; d. Ormsary, Argyllshire, 18 Sept. 1885. He was educated at Glasgow University and Balliol College, Oxford, and after a term as assistant-master at Rugby was appointed assistant professor of Latin at Saint Andrews in 1857 and professor in 1861. In 1868 he was made principal, and thereafter was generally known as "Principal" Shairp. From 1877 he also held the chair of poetry at Oxford. As a critic and expositor Shairp was markedly illuminating and careful. His works consist of 'Kilmahoe, a Highland Pastoral, and other Poems' (1864); 'Studies in Poetry and Philosophy, including essays on Wordsworth, Coleridge and Keble, which furnish some of the best of his writings (1868; 4th ed., 1886); 'Culture and Religion' (1870); 'Life and Letters of J. D. Forbes' (1873), with Tait; 'Poetic Interpretation of Nature' (1877); 'Burns' (1879); 'Aspects of Poetry' (1881). Posthumous collections are 'Sketches in History and Poetry' (1887), edited by Veitch; and

'Glen Dessaray and other Poems' (1888), edited by Pelgrave. Consult Knight, W. A., 'Principal Shairp and his Friends' (London 1888); Sellars, 'Portraits of Friends' (1889); and the article by Dean Boyle in the *Guardian* for 30 Sept. 1885.

SHAKERS, the common name of the United Society of True Believers in Christ's Second Appearing. The name originated in the somewhat violent and irregular motions — leaping, shouting, etc., which were once a part of their worship, but which are so no longer, the motions of the Shakers at worship in these days being uniform and regular, and without sensational features. Although originating in England the sect is wholly American, and presents in its several communities an interesting example of thrift, industry and good morals.

The founder of the Shaker sect was Ann Lee, born at Manchester, England, in 1736. Her father was a blacksmith, and she became at an early age the wife of a blacksmith. She was converted in 1758 by the preaching of Jane Wardlaw, a member of the Society of Friends, who exhorted the people to repent of their sins, declaring that the end of all things was at hand, that Christ was about to reign, and that his second appearance would be in a woman's form. Ann Lee also preached, and was put in prison at Manchester on a charge of disturbing the public peace. When released she began preaching again, and announced that the Lord Jesus had stood before her in prison, and had become one with her in form and spirit. She called herself "Ann the Word," but her followers gave her the title of "Mother Ann." She was persecuted and annoyed to such a degree that she emigrated to America with seven companions, and formed the first Shaker settlement at Watervliet, near Albany, N. Y. Here she also endured imprisonment with some of her followers who refused to bear arms in the War of Independence, on the ground that it was against their principles to serve as soldiers. Ann Lee died 8 Sept. 1784, having witnessed the founding of two new Shaker communities, one at Hancock, the other on Mount Lebanon, New Lebanon, N. Y., the first Shaker meeting house being established in the year following her death, at Mount Lebanon, which is still the most flourishing of the Shaker communities. Joseph Meacham, one of Ann Lee's successors, gave to the Shakers their effective organization, which combines thorough business methods with strict adherence to the principles of their faith. There is no marriage, the two sexes occupying rooms in separate parts of houses, and when married couples join the society, they regard each other as brothers and sisters only. The men do the work of farm and garden, factory and shop, and some widely extended industries owe their origin to the inventive ability of the Shakers. The women cook and attend to the housework, every room being a model of cleanliness. They do much of the tailoring and repairing; prepare seeds and medicines for market, and make butter and cheese. Everybody is occupied, and there is no room or attraction for drones.

Alcoholic liquors are known only as a medicine, and good health is so general that there is but little need for medicine of any kind. The use of tobacco is tabooed, and the diet,

while both generous and varied, does not include flesh-meat or fish. The fact that Shakers live, as a rule, to an advanced age, and enjoy excellent health, is adduced in favor of abstinence from meat. It is also noted as significant that none of the Shakers suffer from cancer.

The Shaker belief agrees in certain respects with that of the Quakers, from whom the original Shakers were an offshoot. They give due respect to the civil law, but they reject ecclesiastical supremacy and military service. Members of the sect who had previously served as soldiers have refused to accept pensions after joining the Shaker community, and it was largely, if not chiefly on evidence of this fact that President Lincoln ordered the release of Shakers who had been imprisoned for refusing to serve, when drafted for the Civil War. The sum saved to the government in the refusal to accept pensions would have more than paid for substitutes for the Shakers who had been drafted.

The Shakers believe that God is king; that the sin of Adam is atoned, and that man is free of all errors except his own; that every human being will be saved, and that the earth is heaven, now soiled and stained, but ready to be brightened by love and labor. They believe in the immediate revelations of the Holy Ghost, and they regard angels and other spirits as maintaining companionship and intercourse with those who have been purified and exalted by the gifts of grace. Shakers believe that at death they merely throw off the bodily garment, and change the form of their existence, but no more. They expect no resurrection of the body, the spirit, when it has left the mortal frame being done with it.

The Shakers are steadily diminishing in numbers. At its greatest their membership was 4,869; and it is now less than 1,000, in 17 societies, distributed over the States of New York, Massachusetts, New Hampshire, Maine, Connecticut, Ohio and Kentucky.

SHAKESPEARE, William, English dramatic poet: b. Stratford-on-Avon, Warwickshire, in April (?) 1564; d. there, 23 April 1616. About a century ago, George Steevens, one of the most eminent Shakespearian editors and critics of that period, wrote thus: "All that we know with any degree of certainty concerning Shakespeare is — that he was born at Stratford-on-Avon, married, and had children there; went to London, where he commenced acting and wrote poems and plays; returned to Stratford, made his will, died and was buried." And Tennyson is reputed to have said: "The world should be thankful there are but five facts absolutely known to us about Shakespeare: the date of his birth, 23 April 1564; his marriage at 19 to Ann Hathaway; his connection with the Globe Theatre, and with Blackfriars; his retirement

from theatrical life, with a competency, to Stratford; and the date of his death, which took place upon the anniversary of his birth, 1616."

If this were strictly true, however, it should be understood that there is nothing exceptional in it, though certain writers who deny that Shakespeare wrote the works ascribed to him have laid much stress upon it. The biographies of the great majority of literary men of that time, especially the dramatists, are as meagre as Shakespeare's. In the latest sketch of the lives of Beaumont and Fletcher (in the 'Mermaid' series of English dramatic writers) the editor says: "Beaumont and Fletcher, though not of obscure origin, like the greater number of their fellow dramatists, yet afford no exception to the general rule in the obscurity that surrounds their lives." The volume of the same series devoted to Webster and Tourneur begins thus: "Nothing is known about the lives of John Webster and Cyril Tourneur. We are ignorant where they were born and when they died," etc. The history of Marlowe, Massinger, and other prominent dramatists of the period is much the same, as reference to their names in the present work will show.

This is also true, as already intimated, of great authors other than playwrights. Professor Hales begins his biographical sketch of Spenser ('Globe' ed. of his works) thus: "The life of Spenser is wrapt in a similar obscurity to that which hides, from us his great predecessor Chaucer, and his greater contemporary Shakespeare. . . . The birth-year of each poet is determined by inference. The circumstances in which each died are a matter of controversy. What sure information we have of the lives of each one is scanty and interrupted."

These quotations might be multiplied if space permitted. It is clear, therefore, that no theory or argument concerning the authenticity of the works of Shakespeare can be based upon the lack of information concerning the man.

Our positive knowledge of Shakespeare's personal history, however, is by no means so limited as Steevens and Tennyson represent. The investigations of the last 50 or 60 years in municipal, theatrical and other records, in the literature of the Elizabethan and succeeding periods, and in other sources of information, have brought to light a multitude of indisputable facts concerning the man and his works.

Unfortunately, the first biography of Shakespeare worthy of the name was not written until 1709, or nearly a century after his death, being prepared by Nicholas Rowe as an introduction to his edition of the poet's works. It was based mainly upon the researches of Betterton, the actor, who a few years earlier had visited Stratford for the express purpose of ascertaining what could be learned there about the personal history of the dramatist. He communicated the results of his investigations to Rowe, to whom we are indebted for the preservation of these and other fragments of information which otherwise would have been lost. Rowe appears to have exercised great caution in dealing with his materials, discriminating carefully between what he regarded as established fact and as doubtful tradition. A few errors have been detected in the minor details that he gives, but the more important

particulars have been verified by later researches.

For almost a century after the appearance of Rowe's 'Life' no serious attempt was made to improve upon it. Pope, Johnson and Steevens, in the biographical sketches prefixed to their editions of Shakespeare, substantially repeated Rowe's matter. Edmund Malone was the first to attempt a biography on a more extended scale. In the introductions to the 'Variorum' editions of 1803, 1813 and 1821, he presented a large amount of new information, based on his researches in the Stratford archives, the manuscripts collected by the actor and manager, Edward Alleyn, at Dulwich, and official records and documents in London. His 'Life of Shakespeare,' as completed and published in the 'Variorum' of 1821, fills 287 octavo pages; and to this the discussion of the chronological order of the plays adds 180 pages more.

Of the many contributions to Shakespearean biography since the time of Malone, the most important have been made by Mr. Halliwell-Phillipps, who, between 1850 and his death in 1889, continued the examination of the ancient records and documents likely to throw light upon the subject, and printed the results in successive publications and finally in the monumental work in two royal octavo volumes which he modestly entitled 'Outlines of the Life of Shakespeare,' the 9th edition of which was issued in 1890. Mr. Sidney Lee's 'Life of Shakespeare' (1898) is the most noteworthy of the other biographies published in the last half-century.

Of Tennyson's "five facts" the first is a mere conjecture. William Shakespeare was baptized, as the parish record proves, on 26 April (O. S.), but the date of his birth is not known. It has been assumed that it was 23 April (3 May by the New Style calendar) because babies were often baptized three days after birth. The only other evidence bearing on the case is the inscription on the poet's monument at Stratford, which tells us that he died 23 April 1616, in the 53d year of his age. If he died on the anniversary of his birth, it might be said, according to the usage of the time, that he was in his 53d year; but the inscription *proves* nothing except that he could not have been born later than 23 April 1564.

John Shakespeare, the poet's father, was of the yeoman class, and had been a farmer in a neighboring village before he came to Stratford about 1553, and adopted the trade of a "glover," dealing also in wool and agricultural produce, with which his former occupation made him familiar. His ability and public spirit are shown by his rapid success in business, which soon enabled him to buy two houses in Stratford, and by his rising through the lower grades of office to that of high bailiff, or mayor, of the town in 1568. His wife, Mary Arden, belonged to a minor branch of an old Warwickshire family, and inherited a considerable estate from her father.

John and Mary Shakespeare had four sons and four daughters. William was the third child, but the eldest son. Of his early years nothing is known, but it is probable that at the age of seven (the earliest at which he could be admitted) he entered the Stratford Grammar

School, an ancient institution which, after being closed for some years on account of the dissolution of the local Guild, on whose revenues it was dependent, by Henry VIII in 1547, was re-established by Edward VI in 1553 as "The King's New School of Stratford-upon-Avon." The masters of the school in the poet's boyhood were university men of good scholarship. The studies were mainly Latin, with writing and arithmetic, and possibly a little Greek, which was sometimes taught in the grammar schools at that time. Ben Jonson credits Shakespeare with "small Latin and less Greek"; and we may be quite certain that the boy had no regular schooling except what he got at Stratford. It is evident from his works that he had not the learning which a few of the critics have ascribed to him. His quotations from Latin literature are such as a schoolboy might make from Virgil, Ovid and the other authors he had studied; and his allusions to classical history and mythology are mostly from the same sources, or from the familiar stock in English books of the period. The historical materials of his plays are evidently from a very limited number of English authorities, like Holinshed's 'Chronicles' and North's 'Plutarch'; and in the use of these he often makes mistakes of which an average scholar could never be guilty.

It should be understood that the notion that Shakespeare was a learned man is of comparatively modern date. In the reference to the dramatist in the literature of his day and for a century after his death (as carefully collected by the New Shakspere Society of London) there is no hint of it, while expressions of the contrary opinion are frequent. John Hales of Eton, writing before 1633, and referring to a conversation concerning Shakespeare in which Sir John Suckling, Sir William Davenant, Ben Jonson and he himself were engaged, says that, "hearing Ben frequently reproaching him [Shakespeare] with the want of learning and ignorance of the ancients," he [Hales] "told him that, if Mr. Shakespeare had not read the ancients, he had likewise not stolen anything from them (a fault the other made no conscience of), and that, if he would produce any one topic finely treated by any of them, he would undertake to find something upon the same subject at least as well written by Shakespeare." Jasper Mayne, writing in 1637, mentions Shakespeare among the dramatists, who did their work "without Latin helps." H. Ramsay, also in 1637, complimenting Ben Jonson for his knowledge of Latin and Greek, says that he

"could command
That which your Shakespeare could scarce understand."

Leonard Digges, in the verses prefixed to the 1640 edition of Shakespeare's 'Poems,' compliments him for his "Art without art, unparalleled as yet," and adds that he borrows nothing from Greek or Latin; yet, as he says, Shakespeare's 'Julius Cæsar' ravished the audience,

"When some new day they would not brook a line
Of tedious (though well labour'd) *Catiline*;"

and "Sejanus" too was irksome—referring to Ben Jonson's Roman plays.

The learned Fuller, in his 'Worthies' (probably written about 1642), says of Shakespeare:

"He was an eminent instance of the truth of that rule, *Poeta non fit, sed nascitur*; one is not made but born a poet. Indeed his learning was very little; . . . nature itself was all the *art* which was used on him." Then follows the familiar passage about "the wit combats between him and Ben Jonson, which two I behold like a Spanish great galleon and an English man-of-war. Master Jonson (like the former) was built far higher in learning; solid but slow in his performances: Shakespeare, with the English man-of-war, lesser in bulk but lighter in sailing, could turn with all tides, tack about, and take advantage of all winds, by the quickness of his wit and invention."

Lady Margaret Cavendish, in the 'General Prologue' to her 'Plays' (1662), after praising Ben Jonson, says:

"Yet gentle Shakespeare had a fluent wit,
Although less learning, yet full well he writ;
For all his plays were writ by Nature's light, etc."

Dryden, in his 'Essay on Dramatic Poesy' (1668), says of Shakespeare: "Those who accuse him to have wanted learning, give him the greater commendation; he needed not the spectacles of books to read Nature; he looked inwards and found her there."

The same great critic, in a prologue to Shakespeare's 'Julius Cæsar' in 1672, says of the author of the play:

"So in this Cæsar which to-day you see,
Tully ne'er spoke as he makes Antony.
Those then that tax his learning are to blame;
He knew the thing, but did not know the name.
Great Jonson did that ignorance adore,
And tho' he envied much, admired him more."

Writing again in prose, he alludes to Shakespeare as "wanting that learning and care which Jonson had."

Gerard Langbaine, in his 'Account of the English Dramatic Poets' (1691), says that Shakespeare "was as much a stranger to French as Latin," and that "it is agreed that his learning was not extraordinary"; and yet he ranks "his plays beyond any that have ever been published in our language."

These quotations might be multiplied, but enough have been given to show what was the universal opinion of the best critical judges in the 17th century concerning Shakespeare's lack of learning. Nature, or *genius*, they all agree, more than made up for the deficiency.

The single slight hint of the opposite opinion in writers of the 17th century is in an 'Address' by Nahum Tate (noted for his bad "new-modelling" of 'Lear' and other plays of Shakespeare), printed in 1680. He says: "What I have said concerning the necessity of learning to make a complete poet may seem inconsistent with my reverence for our Shakespeare. I confess I could never get a true account of his learning, and am apt to think it more than common report allows him. But, however, it fared with our author for book-learning, it is evident that no man was better studied in men and things, the most useful knowledge for a dramatic writer." We see that Tate had failed in his endeavor to find proof of Shakespeare's learning, thus indirectly confirming the unanimous testimony of the critics of that time to the contrary.

About the middle of the 18th century, John Upton, the elder George Coleman and a few

WILLIAM SHAKESPEARE

other critics took the ground that certain passages in the plays indicated an acquaintance with Greek, Latin and later foreign authors whose works had not been translated into English when Shakespeare wrote; but they were completely refuted by Richard Farmer, in his famous 'Essay on the Learning of Shakespeare,' published in 1766. Dr. Warton refers to it as "a work by which an end is put forever to the dispute concerning the learning of Shakespeare. It did settle the question until the Baconian heretics revived it and made it the corner-stone of their theory.

Shakespeare's real education, as Tate intimates, was in the study of "men and things." His early years were spent in the heart of rural England, where he became familiar with woodland scenery and life, and imbibed the love of nature which is one of his most marked characteristics. There also he got the minute knowledge of the practical side of country life which has furnished material for many volumes on the plant-lore and garden-craft illustrated in his works, and on his familiarity with hawking, hunting, fishing and the habits of English birds and animals. Warwickshire was, moreover, rich in historical associations. The castles of Kenilworth and Warwick had been centres of political and military interest during the civil wars of the 13th and 15th centuries. Queen Elizabeth's famous visit to the Earl of Leicester at Kenilworth occurred in 1575, when Shakespeare was 11, and his father, who was then a magistrate at Stratford, may have taken the boy with him to see something of the pageant which attracted throngs of visitors from all the region roundabout. The legendary and romantic lore of the district, in which the redoubtable Guy of Warwick was the chief hero, must also have stirred and stimulated the poet's youthful imagination. Coventry, in the same county, was renowned for its old religious plays, which were not entirely suppressed until 1580; and traveling companies of players visited Stratford when he was five years old and frequently during his boyhood and youth. He must have witnessed these local performances, if not some of those at Coventry, and we can imagine how they developed his taste and love for the drama. The training in the grammar school was an insignificant part of his early education compared with what he got outside of its ancient walls.

It is not improbable that he left school when he was 13. About that time his father's fortunes were declining, probably on account of the general depression in trade, and he may have needed the boy's help in his business or have found other work for him. An improbable tradition says that he was bound apprentice to a butcher, but later ran away to London. According to another tradition, he was an attorney's clerk for a time; and the knowledge of law shown in his works has led Lord Campbell and other professional critics to give credit to this story. Judge Allen, however, in his 'Notes on the Bacon-Shakespeare Question' (Boston 1900), has shown that similar familiarity with legal technicalities appears in the works of contemporary dramatists, and that Shakespeare often makes mistakes in these matters which no lawyer or student of law could be guilty of.

Shakespeare's marriage, when he was be-

tween 18 and 19, is the next fact in his history of which we have positive proof. The bride, Ann Hathaway, was about eight years older. She was the daughter of a farmer in the neighboring village of Shottery, and the house in which her father, Richard Hathaway, is supposed to have lived, was bought in 1892, as Shakespeare's birthplace in Stratford had been bought in 1848, for preservation in memory of the poet. The marriage probably took place early in December 1582, a bond, authorizing it "with once asking of the bans" being still extant in the Episcopal archives of Worcester, the diocese in which the parties resided. The bond bears the date of 28 Nov. 1582, but no record of the marriage, which was doubtless in one of the neighboring villages, has survived the risks to which English parish registers were often exposed. A daughter was born to the pair the next May, her baptism with the name Susanna being recorded at Stratford on Sunday, 26 May 1583. Twin children, Hamnet and Judith, were baptized, 2 Feb. 1585, about two months before their father was 21.

The marriage had evidently been a hurried one, urged on by the relatives of the bride, but apparently not favored by those of the bridegroom, who could not honorably avoid it, and seem not to have been inclined to do so. Some biographers believe that the couple had been formally betrothed some months before the marriage, according to the custom of the time, and this is by no means improbable. The betrothal was then a legal ceremony, consisting in the interchange of rings, kissing and joining hands, in the presence of witnesses and often before a priest. Violation of the contract was punished by the ecclesiastical law with excommunication; and the betrothal was a legal bar to marriage with another person, except by the joint consent of the parties. In Shakespeare's time, at least among the common people, it was often regarded as conferring the rights and privileges of the more formal union that was to follow; but later in the century the Church authorities condemned this license. There may have been such a pre-contract, or betrothal, in the case of William and Ann. In the absence of any positive testimony to the contrary, it is no more than fair to allow them the benefit of the doubt.

It is an interesting fact that this ancient betrothal is introduced by Shakespeare in at least seven of his plays,—'The Two Gentlemen of Verona,' 'The Taming of the Shrew,' 'Twelfth Night,' 'The Winter's Tale' (twice), 'Much Ado,' 'Measure for Measure,' and 'King John.' In 'Twelfth Night,' Olivia, who has been betrothed to Sebastian, supposing him to be the disguised Viola, addresses the latter as "husband," and justifies herself by appealing to the priest before whom the ceremony had been performed, with the understanding that it was to be kept secret until the marriage should take place. Similarly, Robert Arden, the poet's maternal grandfather, in a legal document, calls his daughter Agnes the wife (*uxor*) of the man to whom she was married three months later.

Of Shakespeare's life after his marriage until he went to London nothing further is known. How he managed to support his family we cannot guess. He could have little or no assistance from his father, who, in his re-

duced circumstances, could barely take care of his own household in which there were now four younger children. William soon decided to leave his wife and babes in Stratford—or perhaps at Shottery with Mrs. Hathaway, then a widow with a comfortable house and income—and to try his fortune in London. The precise date of this move is uncertain, but it was probably in the latter part of 1585 or early in 1586. He came of age in 1585, and that fact may have influenced him in making the venture. Tradition says that about this time he was caught in deer-stealing on Sir Thomas Lucy's estate, and that his departure for the metropolis was prompted or hastened by the prosecution that followed the offense. That the poaching tradition was founded on fact is quite certain from the evidence in '2 Henry IV' and the 'Merry Wives of Windsor' that Lucy is caricatured as Justice Shallow. The "dozen white luses" in the latter play were apparently suggested by the three luses, or pikes, in the arms of the Lucy family; and the allusions to poaching in the context are equally significant.

What Shakespeare found to do on his arrival in London we do not know. The tradition that at first he held horses at the door of the theatre, said to have originated with Sir William Davenant, is not improbable, as it was then common for gentlemen to go to the theatre on horseback. We know that somehow the young man soon got into one of the two playhouses then established in London—the Theatre and the Curtain—where he doubtless had to begin in some humble capacity. According to tradition, he was first employed as a "prompter's attendant, whose duty it was to give the performers notice to be ready to enter" on the stage. Soon, however, his abilities must have been recognized, and he began his career of an actor in small parts, gradually working his way up to a better position in the company.

If he went to London in 1585, seven years elapsed before we have any positive information about him, or even any tradition worth mentioning except that of his holding horses at the door of the theatre and his first employment inside as "call-boy." At length, in 1592, we hear about him through a contemporary playwright, Robert Greene, who died in the autumn of that year, leaving a little book, 'Greene's Groatsworth of Wit, bought with a Million of Repentance,' to be published after his decease. After referring to some of his fellow dramatists, Greene says of the actors: "Yes, trust them not, for there is an upstart crow, beautified with our feathers, that, with his *Tygers heart wrapt in a Players hide*, supposes he is as well able to bombast out a blanke verse as the best of you; and being an absolute Johannes Factotum, is in his owne conceit the only Shake-scene in a cuntry." That the epithet of "Shake-scene" refers to Shakespeare cannot be doubted, and the passage implies that he was both actor and author, and perhaps plagiarist also. "Beautified with our feathers," as some believe, may refer to plagiarism, but it may simply mean gaining credit by acting what others have written. The italicized quotation is a parody of "O tiger's heart wrapt in a woman's hide" in '3 Henry VI,' an old play in which Greene is supposed to have had a share and which was revised by

Shakespeare. In December 1592, Henry Chettle, who had published Greene's pamphlet for him, brought out his own 'Kind Harts Dreame' in which he apologizes for Greene's sneer at Shakespeare and adds: "Myselfe have seene his demeanor no less civill than he exelent in the qualitie (of actor) he professes; besides, divers of worship (people of rank) have reported his uprightness of dealing, which argues his honesty, and his facetious (felicitous) grace in writing, that approves his art." It is clear from Greene's envy and Chettle's eulogy that, in 1592, Shakespeare had already won credit, not only by his acting, but also by revising old plays for reproduction on the stage.

Little is known of the poet's personal history from this time until 1600. In 1596 his son Hamnet died, and was buried (11 August) at Stratford. Early in 1597 he bought New Place, a mansion with an acre of land in the best part of Stratford, and later added other lands to the estate. In 1596 John Shakespeare, doubtless by his son's advice, made application to the College of Heralds for a coat-of-arms; but the negotiations not being concluded at that time, they were renewed in 1599, when the petition was granted.

John had asked that he and his son might be allowed to quarter on the coat the arms of the Ardens of Wilmecote, his wife's family; but the heralds substituted the arms of the Ardens of Alvanley in Cheshire, apparently because those belonged to a younger branch of the family, from which Mary Arden was descended.

Shakespeare repaired New Place, which was in a dilapidated condition when he bought it. We find evidence also that he assisted in restoring the fortunes of his father and attempted to regain certain real estate belonging to his mother which had been forfeited through complications due to a mortgage.

The earliest definite notice of Shakespeare's appearance on the stage is of his having been a player in two comedies acted before Elizabeth at Greenwich Palace in December 1594. According to the official records "William Kempe, William Shakespeare and Richard Burbage" then received £13 6s. 8d. as payment, with £6 13s. 4d. in addition "by waye of her Majesties rewarde"—that is, as a perquisite.

Other performances before Elizabeth were in 1596, twice during the Christmas holidays, at Whitehall; at Richmond Palace on Twelfth Night and Shrove Tuesday, 1600; and at Whitehall, 26 December the same year. At Christmas time, 1601–02, the company played four times at Whitehall; and at Richmond, 2 Feb. 1603—the last occasion on which they could have appeared before Elizabeth, as she died 24 March 1603.

Shakespeare's income from acting was much greater than from authorship. From the former source before 1599 it was probably £100 a year, to which the perquisites from performances at court might add £15 or more. During the same period the prices for a play ranged from £6 to £15. His receipts from revising and writing plays up to 1599 probably did not exceed £20 a year, making his entire income about £135, equal to from seven to 10 times as much in modern money. From the quarto editions of his plays, all of which were piratical, he received nothing; but from the editions of his

poems—the only works printed under his own control—he may have got something, but we have no means of estimating the amount.

When the Burbages built the Globe Theatre in 1599, they leased shares in it for 25 years to “those deserving men, Shakespeare, Hemings, Condell, Phillips and others,” all of whom were players in Shakespeare’s company. There were 16 shares in all, of which Shakespeare probably had two. The annual receipts of the theatre are supposed to have been about £8,000. The yearly income of a share in 1635 is known to have been more than £200. In 1600–10 it may not have been so large, but Shakespeare must have received from the theatre, as an actor and a shareholder, at least £500 a year. From 1599 the prices of plays averaged £20 or more and performances at court were more frequent and doubtless better paid.

In 1602 Shakespeare bought 107 acres of land near Stratford for £320, and the same year he bought a cottage and garden near New Place. These investments, and his dealings in agricultural produce of which we have documentary evidence, were additional sources of income.

According to Rowe, the poet once received a gift of £1,000 from his generous patron, the Earl of Southampton. There can be little doubt that the amount is exaggerated, but the Earl, who is known to have been so liberal to others, can hardly have omitted to make some substantial acknowledgement of the tribute paid him in the dedications of ‘Venus and Adonis’ and ‘Lucrece.’

In May 1602, almost immediately after he came to the throne, King James granted a license to Shakespeare and his company to play in London and the provinces. They performed not infrequently afterward at court, as the records show; and on 15 March 1604, when James made his formal passage from the Tower to Westminster, Shakespeare and the eight other actors to whom the royal license had been granted in 1603, marched in the royal train, and each was presented with four and a half yards of scarlet cloth, the usual dress-allowance of actors belonging to the royal household. We have little positive information of the parts played by Shakespeare himself. It is reported that he took that of Adam in ‘As You Like It,’ and, according to Rowe, he acted ‘the Ghost in his own ‘Hamlet.’” John Davies of Hereford (1610) says that he “played some kingly parts in sport.” His name heads the list of those who took part in the first performance of Ben Jonson’s ‘Every Man in His Humour,’ in 1598. In the list of “the principall actors in all these playes” prefixed to the Folio of 1623, his name is also placed first, but perhaps only because he was the author of the plays. There is no evidence that he ever gained high rank as an actor.

In July 1605 Shakespeare paid £440 for the unexpired term (31 years) of the moiety of a lease of the tithes of Stratford, Old Stratford, Bishopton and Welcombe. It appears to have been a good investment, for his son-in-law, Dr. John Hall, in August 1624, disposed of his interest in the remainder of the lease for £400 or only £40 less than it cost Shakespeare 19 years before. The lease had now only 12 years to run, but the officers of the Stratford Corporation who bought it appear to

have regarded it as a judicious investment at £400.

On 5 June 1607 the poet’s elder daughter Susanna, then 24 years of age, was married to Dr. John Hall, a physician who had a large practice among the good people of Stratford and the adjacent country. He was several times called to attend the Earl and Countess of Northampton, at Ludlow Castle, more than 40 miles off. His medical case-book, written in Latin, was translated and published in London (1657) after his death, and was reprinted in 1679 and 1683. Though an earnest Puritan, he was none the less popular with those who were bitterly opposed to the sect.

Shakespeare’s brother Edmund died in London, in December 1607, and was buried in Saint Saviour’s Church, Southwark. He is described in the parish register as “a player,” and had probably come to London and entered the Globe Theatre through his brother’s influence, but no notice of him as an actor has been discovered.

Elizabeth, the only child of the Halls, was baptized 21 Feb. 1608. The poet thus became a grandfather about two months before he was 44. She was married in 1626 to Thomas Nash, a citizen of Stratford, who died in 1647. Two years later she married Sir John Barnard of Abington Manor, near Northampton. She had no children by either husband. The last of the poet’s lineal descendants, she was buried at Abington, 17 Feb. 1669, but no monument marks her grave. In September 1608, Shakespeare’s mother died, her burial being recorded on the 9th of the month. Her husband, John Shakespeare, had died seven years earlier, the record of his burial being dated 8 Sept. 1601. He left no will and his son William inherited the Henley Street birthplace. Shakespeare’s brother Gilbert (baptized 16 Oct. 1566) was buried 3 Feb. 1612, the record, by a clerical error, calling him “adolescens,” though he was 45 years old. In February 1613, Richard, his last surviving brother (baptized 11 March 1574), also died. Joan (baptized 11 April 1569) was the only child of John and Mary Shakespeare now remaining. She married William Hart, who died in April 1616, his burial taking place on the 17th, eight days before that of the poet. Joan outlived her husband and brother 30 years.

In 1610 Shakespeare bought 20 acres of pasture land, adding them to the 107 acres acquired in 1602; and in March 1613 he made what appears to have been his last investment in real estate by the purchase of a house in London, near the Blackfriars Theatre. He paid £140 for it, and soon leased it to one John Robinson, who had been one of the opponents to the establishment of the theatre.

It was probably as early as 1611 that Shakespeare returned to Stratford and took up his residence at New Place. In that year his name appears on a list of Stratford citizens who were raising money to promote a Parliament bill “for the better repair of highways.” In the spring of 1614 a Puritan preacher, invited to the town by the corporation, was hospitably entertained at New Place, perhaps through the influence of Dr. Hall, who may have been living with his father-in-law at the time. In the town records we read: “For one quart of sack and

one quart of claret wine given to a preacher at the New Place, xx. d."

In the autumn of 1614 an attempt was made by William Combe, the squire of Welcombe, to enclose a considerable area of the common fields near the town. The project was opposed by the corporation as detrimental to the agricultural interests of the town and tending to diminish the tithes. Shakespeare, as we have seen, was interested in the tithes, but it would appear that he was finally led to favor the scheme by Combe, who guaranteed that he should suffer no pecuniary loss. There is no evidence, however, that he took any active part in promoting the enclosures, which were ultimately thwarted by legal injunction in March 1615.

In February 1616, Judith, the poet's younger daughter, was married to Thomas Quiney, who was nearly four years her junior. He was then in business as a vintner, and patronized by the corporation. In 1617 he was elected a burgess, and from 1621 to 1623 held the office of chamberlain. Later his business was less prosperous, and in 1652 he removed to London, where he died a few years afterward. He had three sons, two of whom died in infancy and the third at the age of 20. Judith Quiney lived to be 76, surviving all her family except her aunt, Joan Hart, and her niece, Elizabeth Barnard.

Shakespeare's health seems to have been failing at the time of Judith's marriage. He had made his will in the latter part of January 1616, as erasures in the document indicate; but for some reason it was not engrossed and signed at that time. In April the condition of the poet seems to have become suddenly worse, and the rough draft of the will, after a few alterations and interlineations, was signed without waiting for a clean transcript of it.

There is no mention of his wife in the will except the interlined bequest of the "second best bed with the furniture"; but she was amply provided for by her rights of dower, and such omission in a case of the kind is not uncommon in wills of the time. The gift of the bed, like many similar bequests in these old wills, was doubtless prompted by love and tender associations, not the insult of a dying man to the mother of his children. The misinterpretation of this clause in the will is absolutely the sole ground for the supposition that the poet was unhappy in his conjugal relations, while there is the strongest circumstantial evidence to the contrary. We have seen that more than 20 years earlier in London he was planning for his return to a residence in his native town. In 1597 he was able to buy the best house in Stratford, and he gradually developed and improved the estate, making it an ideal home for his declining years—but not, we may be certain, to be shared with a wife from whom he was estranged. His widow survived him almost seven years (her burial was on 8 Feb. 1623), and tradition says that she earnestly desired to be laid in the same grave with her husband.

The funeral of "Will Shakespeare, gent.," as the parish register informs us, occurred 25 April 1616. His grave is in the chancel of the parish church, the legal place for the interment of the owners of the tithes. It is covered with a stone bearing the inscription:

"Good frend, for Jesus sake forbear
To digg the dust enclosed heare;
Blest be the man that spares thes stones,
And curst be he that moves my bones."

It was not until about 70 years after his death that these lines were ascribed to Shakespeare. Neither Dugdale, in 1656, nor Rowe, in 1709, when referring to the tomb, attribute them to him. If he desired that something to the same effect should be put upon the stone, it was doubtless from fear that his bones might some day be removed to the ancient charnel house that then adjoined the church but was afterward demolished.

The monument to the poet on the chancel wall was erected before 1623. The life-sized bust is supposed to have been copied from a posthumous cast of his face. It is poor as a work of art, but it must have been accepted by his surviving relatives as a tolerably good portrait. It bears a general resemblance to the only other portrait the authenticity of which is established—the engraving in the Folio of 1623, the execution of which is equally bad. A painted portrait in the Shakespeare Memorial Gallery at Stratford is believed by many to be the original of that engraving, but others think it was copied from the engraving. The so-called Ely House portrait, according to some critics, was the basis of the engraving. There are many other alleged portraits, but their history is more or less doubtful.

The order in which Shakespeare's works were written has been the subject of much discussion and dispute, but is now approximately settled. If he wrote the repulsive tragedy of 'Titus Andronicus,' it was probably as early as 1590; but the critics generally agree that it was an old play slightly retouched by him about that time. The three parts of 'Henry VI' are quite certainly other plays upon which he worked in the same way during his dramatic apprenticeship, the second and third parts having a considerably larger share of his work than the first part. When he attempted wholly original work, it was in comedy, and 'Love's Labour's Lost' was the play. The first version must have been written as early as 1591, the present one, printed in 1598, having been, as the title-page states, "newly revised and augmented." 'The Two Gentlemen of Verona' and 'The Comedy of Errors' soon followed, together with the first draft of 'Romeo and Juliet,' which was afterward revised and enlarged. 'Richard III,' which naturally follows the trilogy of 'Henry VI,' appears, on the whole, to be entirely Shakespeare's, and was probably written in 1592 or 1593, and 'Richard II' soon afterward, though the earliest extant editions of both plays date only from 1597. 'A Midsummer Night's Dream' belongs in the group of early comedies, but was the last of the series, being generally ascribed to 1594.

'Venus and Adonis' appeared in 1593, and the poet, in the dedication to the Earl of Southampton, calls it "the first heir of my invention," or imagination; but this seems to mean that it was his first literary production, plays in that day not being regarded as literature properly so called. The poem was published in 1593 and ran through at least 12 editions in the next 16 years. 'Lucrece,' also dedicated to Southampton, was published in 1594

and was almost as popular, eight editions being extant.

During the next six years (1595-1600) the poet completed the series of English historical plays (except 'Henry VIII'), the order apparently being 'King John' (1595), 1 and 2 'Henry IV' (1596, 1597) and 'Henry V' (1598). 'The Merry Wives of Windsor,' said to have been written at the request of Elizabeth, probably came between '2 Henry IV' and 'Henry V.' 'The Merchant of Venice,' written in 1596 or 1597, together with all the plays mentioned above, except 'Henry VI,' is included in a list of Shakespeare's dramas in Francis Meres's 'Palladis Tamia,' published in September 1598. 'The Taming of the Shrew' (based upon the anonymous 'Taming of a Shrew,' printed in 1594), though not mentioned by Meres, was probably produced in 1597, at the latest. Meres ascribes to Shakespeare a play entitled 'Love's Labour's Won,' which may be the 'Taming of the Shrew,' though many critics believe it to be an early form of 'All's Well that Ends Well.'

Between 1598 and 1600 the three brilliant comedies, 'As You Like It,' 'Much Ado About Nothing' and 'Twelfth Night' were written, but in what order is uncertain. 'Julius Cæsar' belongs to the same period. These plays were followed by 'All's Well that Ends Well,' 'Measure for Measure' and 'Trolius and Cressida,' the dates of all which are more or less doubtful; but these plays, which are comedies only in not having a tragic ending, seem to form a natural group, leading up to the period of the great tragedies, if not partly belonging to it. 'Hamlet' introduces the latter group, the earliest quarto edition having been printed in 1603. It was followed in 1604 by a second quarto, described as 'newly imprinted and enlarged to almost as much again as it was.' 'Othello' was probably a new play when it was performed before King James in November 1604. 'Macbeth' is generally dated in 1606 or 1607, and 'King Lear' was produced at about the same time. 'Antony and Cleopatra' and 'Coriolanus' are supposed to have been written in 1607 or 1608.

The tragedies were followed by a group of three plays which have been aptly called "Romances": 'Cymbeline,' 'The Winter's Tale' and 'The Tempest'; all written in 1609-11, and not improbably in the order mentioned. Campbell, the poet, believed that 'The Tempest' was the last of the plays, James Russell Lowell expressed the same opinion, and many critics agree with them, but some think that 'The Winter's Tale' was the later work.

Besides the plays of mixed or doubtful authorship belonging to Shakespeare's earliest period and 'The Taming of the Shrew,' there are several others of later date which appear to have a similar history: 'Timon of Athens,' 'Pericles' and 'Henry VIII.' Shakespeare's share in all of them is indisputable, but the critics disagree in explaining the divided authorship. The most plausible theory is that all three were begun by Shakespeare, but for some unknown reason were laid aside or left unfinished and afterward completed by others. In the case of 'Timon' it is neither known nor suspected who the other author was. In 'Pericles' it was undoubtedly George Wilkins who in 1608 (a year after the play was first printed)

published a novel avowedly based upon it. The first two acts of the play appear to be his, but some believe that the later prose scenes and the Gower prologues are by a third hand. Large portions of 'Henry VIII' are evidently by John Fletcher, some of whose metrical peculiarities are unmistakable. The rest has been ascribed by one or two critics to Massinger, but there can be little doubt that it is Shakespeare's.

'The Two Noble Kinsmen' is another play which some excellent critics believe to be partly Shakespeare's. The title-page of the earliest edition (1634) ascribes it to "the memorable Worthies of their time: Mr. John Fletcher and Mr. William Shakespeare." Fletcher's hand in it is obvious, but it is uncertain who was the other author. The anonymous play of 'Edward III' is ascribed to Shakespeare by certain German critics, and some in England believe that portions of it are his, but it is extremely improbable that he wrote a line of it. Sundry other plays were ascribed to him in his lifetime or afterward, but without authority or warrant.

The 'Sonnets' of Shakespeare were first published in 1609, but Meres in 1598 refers to his "sugred sonnets among his private friends," and two of them were printed in 'The Passionate Pilgrim,' a piratical collection of verse, in 1599. It is probable that the majority of them were written between 1597 and 1601, but some may be of later date. 'A Lover's Complaint,' printed with the 'Sonnets' in 1609, is undoubtedly Shakespeare's. It is in the same stanza as 'Lucrece,' and internal evidence indicates that it was somewhat later than that poem. 'The Phoenix and the Turtle' must have been written before 1601, when it was printed as Shakespeare's in a volume with Chester's 'Love's Martyr' and poems by Marston, Chapman, Ben Jonson and others. In 'The Passionate Pilgrim,' besides the two sonnets mentioned above and two lyrics from 'Love's Labour's Lost,' several other poems are attributed to Shakespeare and printed in the modern editions of his works, but some of them are known to belong to other authors, and it is very doubtful whether any of the rest are his.

No collected edition of Shakespeare's plays appeared until seven years after his death, when the "first folio," or the "folio of 1623," was published. It was nominally edited by two of his friends and fellow-actors, John Heming (or Hemings) and Henry Condell, and contained 36 of the plays included in modern editions, 'Pericles' being omitted. Sixteen of the plays had been already published in quarto form, the other 20 were printed for the first time. The book evidently had no editing worthy of the name. Heming and Condell did little except to furnish the publishers with the best copies of the plays they could get; and these were partly manuscripts and partly early quartos, all of which had been used in the theatre by the actors in learning their parts. This is evident from the fact that in many instances names of actors are inserted at the beginning of speeches and in stage-directions instead of those of the *dramatis personæ*. Every conceivable form of typographical corruption and perversion abounds. It is estimated that at least 20,000 "readings" occur that are clearly wrong or highly suspicious, to say nothing of a far greater

number of minor misprints and mispointings. Verse is often printed as prose and prose as verse. Stage-directions and text are often confounded. Words and phrases from foreign languages are almost invariably corrupted, sometimes to such a degree that critics cannot decide whether they are Latin, French or Spanish. Some plays are divided into acts and scenes, some only into acts, some not at all, and the division is often confused or inaccurate. In face of all these facts the Baconian heretics claim that the folio was edited by Bacon, the plays being carefully revised, corrected and printed when he had abundant leisure for seeing them through the press.

The second folio (1632) was a reprint of the first, with few changes for the better and some for the worse. The third appeared in 1663, and was reprinted in 1664, with the addition of 'Pericles' and six plays falsely ascribed to Shakespeare. The fourth folio (1685) was a reprint of that of 1664, with no material change except that the spelling was somewhat modernized.

No other collected edition appeared until 1709, when Rowe's, based on the fourth folio, was published. The poems were first included in the second edition (1714). Of the other complete editions in the 18th century and the early part of the 19th, the most important were Pope's (1723-25), Theobald's (1733), Hanmer's (1744), Warburton's (1747), Johnson's (1765), Capell's (1768), Steevens's revision of Johnson's (1773), Malone's (1790), Steevens', with Boydell's illustrations (1791-1802), Reed's (1803), Chalmers' (1805) and the 'Variorum' of 1821, edited by James Boswell from a corrected proof left by Malone. Some of these were reprinted more than once.

Since 1821 editions, commentaries and critical and illustrative works on Shakespeare have so enormously multiplied that a list of them, even in the most concise form, cannot be added here. For the bibliography of the subject the reader may be referred to Lowndes's 'Library Manual' (Bohn's ed.); Franz Thimm's 'Shakespeareana' (1864 and 1871); and the 'Shakespeareana' (3,680 titles) of the 'British Museum Catalogue' (published separately in 1897).

The first complete American edition of Shakespeare (with life, glossary and notes by Dr. Johnson) was published in eight volumes in 1795-96, at Philadelphia. The first Boston edition (including only the plays) was in eight volumes (1802-04). Three editions of this appeared, each reset, stereotyping being then unknown. An edition of 17 volumes was brought out in Philadelphia in 1809, and one in seven volumes (edited by O. W. B. Peabody, though his name does not appear in it) in Boston in 1836. Reprints of Reed's text had been issued there in 1813 and 1814. An edition of the plays in 10 volumes (Reed's text) was published in New York in 1821 and again in 1824. The first critical, thoroughly annotated and illustrated American edition was G. C. Verplanck's (3 vols., New York 1844-47). Of more recent editions the only one that can be mentioned here is Horace Howard Furness's 'New Variorum' (the first since 1821, and on a far larger scale), of which 12 volumes have now (1904) been published. This country has also produced the first Concordance to the 'Poems'

(Mrs. H. H. Furness's, 1874) and the best Concordance to the Complete Works (John Bartlett's, 1895). The first critical work on the plays from a *feminine* pen was 'Shakespeare Illustrated' (3 vols., London 1753-54), by Mrs. Charlotte Lennox (1720-1804), who was born in New York, where her father, Col. James Ramsay, was lieutenant-governor. From the age of 15 she lived in England. The dedication of this work to the Earl of Orrery was written by Dr. Johnson. See SHAKESPEARE'S SONNETS; and separate articles on the principal plays.

WILLIAM J. ROLFE,

Author of 'Life of Shakespeare.'

SHAKESPEARE, Authorship of. In the history of controversy over the authorship or the authenticity of writings two debates during the last 100 years have risen into special prominence—that relating to the Homeric poems and that which concerns the works commonly attributed to William Shakespeare. F. A. Wolf (q.v.), in his 'Prolegomena ad Homerum' (1795), essayed to demonstrate that the Homeric poems were not the work of any one man, but a compilation of rhapsodies composed by different minstrels and sung in the public assemblies while yet the art of writing was little known. Before this formidable attack upon the Homeric authorship there had been wide disagreement among critics upon various questions regarding the poems, including the probable date of their composition. Obscurities in respect to these matters are referred mainly to the lack of biographical materials relating to Homer himself. In this particular the case of Shakespeare is involved in almost equal difficulty, although it is not yet 300 years since the reputed dramatist's death. To many it seems scarcely less wonderful that the man who wrote the plays and poems known as Shakespeare's could have remained so far hidden from the world, despite its eager search for him, than that those writings should be the production of a person so obscure. When Hume declared miracles impossible because improbable, Whately, by a mock chronicle, reduced Napoleon to non-entity. But the non-existence of Shakespeare is not asserted in the controversy. They who dispute his authorship base their denial mainly upon antecedent improbability, as Hume did his argument against miracles. Indeed one conspicuous champion of Shakespeare asks: "Why is it not the simplest plan to let Shakespeare stand as a simple miracle?" regarding him as "a much simpler miracle than he would be if any of the current explanations of him were accepted." Critical inquiry, however, still seeks and will seek a cause equal to the effect, a man or men adequate to the result to be accounted for.

Although this authorship controversy, in various phases, had earlier beginnings, it assumed its most definite character about the middle of the 19th century, since when, as Brandes complains, the great name of Shakespeare has been "besmirched by American and European imbecility." "A troop of less than half-educated people," he declares, "have put forth the doctrine that Shakespeare lent his name to a body of poetry with which he had really nothing to do—which he could not have understood, much less have written? Brandes ('William Shakespeare' (1899) cites W. H. Wyman's

'Bibliography of the Bacon-Shakespeare Controversy' (1884), showing that "there had been published up to that date 255 books, pamphlets and essays as to the authorship of Shakespeare's plays. In America 161 treatises of considerable bulk had been devoted to the question, and in England 69. Of these, 73 were decidedly opposed to Shakespeare's authorship, while 65 left the question undetermined. In other words, out of 161 books, only 23 were in favor of Shakespeare. And since then the proportion has no doubt remained much the same."

The anti-Shakespearian view consists of two main theories, that of a composite or a "syndicate" authorship, and that of a single authorship. If the latter be regarded as involving almost a miracle, the other, it has been declared, suggests a combination of miracles. If there was great collaboration there must have been also one master genius whose primacy reduced all partnership to practical insignificance. Yet that there was partnership is evident from the discoveries of critics who show where different hands have set their marks in the plays and poems called Shakespeare's.

The view of single authorship, other than Shakespeare's, as mainly held, is known as the Baconian theory. The earliest recorded surmise that the real author of the Shakespearian writings was Francis Bacon appears to have been that of "a Mr. William Smith," in a privately-printed letter to Lord Ellesmere (1856), basing his opinion on Shakespeare's obvious incapability of producing the works attributed to him, and on the manifold qualifications of Bacon. About the same time Delia Salter Bacon, an American woman, gave a more considerable form to this theory ("delusion," Brandes calls it) in a number of magazine articles, succeeded by a volume, 'The Philosophy of the Plays of Shakespeare Unfolded' (1857), in which she set forth the deficiencies of the "Stratford butcher-boy" and "poacher" in contrast to the attainments of Bacon, to whom she assigned the principal part in the authorship of the plays. She was followed by Nathaniel Holmes, an American jurist and a writer of much literary skill, in a work, 'The Authorship of Shakespeare' (1866, 1886), vigorously supporting the Baconian theory, and giving increased importance to the discussion. Meanwhile a new phase of the subject began to appear in alleged discoveries of a cipher in the plays embodying a confession of his authorship by Bacon himself. This line of investigation was followed by Ignatius Donnelly, an American lawyer and politician, in what Brandes calls "his crazy book," 'The Great Cryptogram: Francis Bacon's Cipher in the so-called Shakespeare Plays' (1st part 1888). This inquiry was further pursued by Donnelly up to his death, and has been continued by others; notably, in America, by O. W. Owen of Detroit, Isaac Hull Platt of New York, and the late R. M. Bucke of London, Ontario. For an exposition of Bacon's anagram, which Platt claims to have discovered in the plays, as well as of Bucke's views, consult "Francis Bacon" in Bucke's 'Cosmic Consciousness' (1901). Apart from the cipher theory, the general reliance of the Baconians is upon points summed up by John Weiss, a reasonable defender of the

traditional authorship, in 'Wit, Humor and Shakespeare' (1876), as follows: "The plays are too great, and out of all proportion to the obscurity which rests upon Shakespeare's life, and to the insignificance of his contemporary fame. They are filled with all kinds of classical allusion, professional information, legal, medical, horticultural, scientific, to an extent which an obscure play-actor could not possibly comprise within the limits of his ragged and scanty education. The plays contain remarkable parallelisms with passages in Bacon's works, and coincidences of thought and expression." This is perhaps as fair a summary as could be made in so few words; but the Baconians multiply instances and arguments with great extension and cumulative force, finding in Bacon's 'Promus' especially, but also in many places throughout his writings, words and passages which they cite in proof.

Among suggesters and advocates of the "syndicate" theory is Appleton Morgan of New York, who in his work 'The Shakespearian Myth' (1880), advanced the view that the plays were jointly produced by at least two men, one a poet and dramatist, the other a business man connected with a theatre; and in later writings this author has amplified this conjecture, which has also been elaborated by "A Cambridge Graduate" in a volume entitled 'Is It Shakespeare?' (1903). It is likewise set forth by William H. Edwards in 'Shaksper not Shakespeare' (1900). "It is enough for me," he says, "to prove that William Shaksper did not write these plays. Who did, I know not, and offer no suggestions: but when the venerable Shakespeare image has tumbled, and the critics have a little time to clear their eyes of dust and cobwebs, the real authors may be discovered—authors, for I believe there were several associates who wrote under the assumed name of 'William Shakespeare.'"

Toward all this anti-Shakespearian argument the general attitude of writers on the other side has been that of ridicule and contempt. The persistence of the unorthodox, however, has compelled, in the interest of the Shakespeare cause, as well as in that of free scholarship and fair investigation, a more serious attention on the part of those who would uphold the traditional view. The burden of proof thus far is on the unorthodox, and of necessity their proofs hitherto are chiefly negative. But so too are the arguments of their opponents, who, at least with respect to Bacon, can do little more than set one great improbability against another, adducing also whatever they can of a positive nature from scanty documentary sources, the witness of Shakespeare's contemporaries, oral tradition, and the like. The consensus of Shakespearians on the conservative side finds in these evidences probabilities at least in which they are content to rest until overcome by resistless demonstration. To the Baconians their answer is perhaps sufficiently conveyed in the conclusion of Sidney Lee in his 'Life of William Shakespeare' (1898): "The abundance of contemporary evidence attesting Shakespeare's responsibility for the works published under his name gives the Baconian theory no rational right to a hearing; while such authentic examples of Bacon's effort to write verse as survive prove beyond all possibility of contradiction that, great as he was as

a prose-writer and a philosopher, he was incapable of penning any of the poetry assigned to Shakespeare." And yet, in view of all that has followed from the work of Della Bacon, it seems proper to repeat Emerson's remark, that she opened this question "so that it can never again be closed," at least until positive proofs on one side or the other shall be produced. Meanwhile a liberal spirit of investigation can hardly deprecate the controversy which has already thrown so many side lights upon the Shakespearian literature and tradition. Besides the above works cited, of which Wyman's 'Bibliography' is especially important as a source of reference, a few of the more recent writings on the subject may be mentioned.

Bibliography.—White, 'Studies in Shakespeare' (1886); Stopes, 'The Bacon-Shakespeare Question Answered' (1889); Owen, 'Sir Francis Bacon's Cipher Story Discovered and Deciphered' (1893-94); Reed, 'Bacon vs. Shakespeare: a Brief for the Plaintiff' (7th ed., 1897); 'Bacon and Shakespeare Parallelisms' (1902); 'Francis Bacon Our Shakespeare' (1902); Allen, 'Notes on the Bacon-Shakespeare Question' (1900); Bayley, 'The Tragedy of Sir Francis Bacon: an Appeal for further Investigation and Research' (1902); Crawford, 'The Bacon-Shakespeare Question' (in 'Notes and Queries,' series 9, Vols. IX-XI, 1902-03); Gallup, 'The Bi-literal Cypher of Sir Francis Bacon' (1902); Mallock, 'Last Words on Mrs. Gallup's Alleged Cypher' (in *Nineteenth Century and After*, Vol. LIV, pp. 55-71, 1902); 'A New Light on the Bacon-Shakespeare Cypher' (1902); 'New Facts relating to the Bacon-Shakespeare Question' (in the *Pall Mall Magazine*, Vol. XXIX, pp. 77-89; 215-228, 1903); Lang, 'Mrs Gallup and Francis Bacon' (in *Monthly Review*, Vol. II, pp. 146-162; 1902); Webb, 'The Mystery of William Shakespeare: a Summary of Evidence' (1902); Boubée, 'Shakespeare ou Bacon?' (1903); the various writings on the subject by Edwin Bormann, published in Leipzig (1895-1903); and the publications of the Bacon Society. The latest work is entitled 'The Greatest of Literary Problems,' which is a history of every phase of the controversy, and contains a bibliography covering works in every European country (Boston 1915).

SHAKESPEARE SOCIETIES. The first Shakespeare society was founded in 1841, in London, and before its dissolution in 1853, had published 48 volumes. A new English Shakespeare society was organized in 1874, and the German Shakespeare Society was founded at Weimar in 1864. In the United States the Shakespeare Society of New York was organized in 1885. The latter has published the 'Bankside Shakespeare' (20 vols., 1888-92) and 'The Bankside Restoration Shakespeare' (1907). The Shakespeare Association was founded in London in 1914 and Mr. Israel Gollancz was chosen first president. The publications of the various societies have done much for Shakespearian scholarship through verse texts and publishing the text of the quartos alongside the texts of the early folios.

SHAKESPEARE'S SONNETS. The Sonnets of Shakespeare were published in 1609, in a small quarto volume which is generally thought to have been "piratical," that is,

to have been issued without the author's consent. The circulation of poems in manuscript form was a common matter in the Elizabethan age, and there is direct evidence that it had been taking place in the case of these sonnets; for Francis Meres, in a little work called 'Palladis Tamia,' published 1598, observed: "As the soul of Euphorbus was thought to live in Pythagoras, so the sweet witty soul of Ovid lives in mellifluous and honey-tongued Shakespeare, witness his 'Venus and Adonis,' his 'Lucrece,' and his sugared Sonnets among his private friends." In the following year, 1599, two of the sonnets were published in the piratical compilation called 'The Passionate Pilgrim.' For these and other reasons it is assumed that a good part of Shakespeare's Sonnets had been written a considerable time before the publication of the volume of 1609; but as to the period of his life most likely to be represented by them, there is no general agreement. Some critics regard them as early compositions, largely completed by 1594-96; others as having been written largely in the period 1598-1603; while still others assume, in the absence of definite evidence, that they may have been produced at intervals throughout Shakespeare's literary life. It is agreed, however, that few are to be attributed to his later period, that is, after 1603.

The Sonnets are 154 in number, and are written in the form sometimes called "English" to distinguish it from the more orthodox "Italian" sonnet form; that is, each of them is divided into four quatrains and a final couplet, by the rhyme-scheme *abab, cdcd, efef, gg*. This form had already been used successfully by Samuel Daniel in a popular collection of sonnets, and it is to his influence that the general form and style of Shakespeare's are most commonly traced; though it is also likely that he had studied the sonnets of Sir Philip Sidney, by far the finest sonneteer of the early Elizabethan age, and perhaps those of Michael Drayton as well. How far Shakespeare was acquainted with the work of Italian and French sonneteers we have no means of knowing. None of his sonnets appears to be a translation or direct imitation of a particular source; on the other hand, the themes and rhetorical methods of the continental poets abound in his sonnets, as in those of his English contemporaries, and there is no reason to doubt that he was familiar with the general character and course of the sonnet-writing fashion, which came into England from Italy and France, and reached its height there about 1594-96. A great part of these Renaissance sonnets were issued in the form of "sequences," that is, collections centred around a single theme,—usually a woman (real or ideal) beloved by the poet,—and capable of being read either as single poems or as a connected account of the poet's subjective experiences. In the case of Shakespeare's Sonnets, it is disputed whether they are to be regarded as forming a sequence or not. They have no title or otherwise clearly defined theme; and we cannot say whether they were printed from a single manuscript or from scattered collections, nor whether the order in which they stand in the quarto of 1609 is that in which they were written or that in which they would have been published if Shakespeare

had prepared them for the press. Hence the only evidence as to the unity of the series is internal; and many critics find themselves able to read it as a connected story, while to others it seems to be a mere miscellany, though containing many pairs, trios, and perhaps larger groups of sonnets intended to be read connectedly. The weight of opinion may be said to be that there is a certain unity in the collection, suggestive of the view that the great part of the sonnets have to do with the same persons and events, but that there is no complete continuity such as would result from an authoritative arrangement either for narrative or lyrical ends. As a result of this uncertainty regarding the arrangement of the Sonnets, they have been rearranged by many editors and critics, in accordance with individual theories. Perhaps the most plausible and useful of these rearrangements is that of C. M. Walsh, in his edition of 1908; this is based not on any constructive theory, but on the effort to group the sonnets according to internal evidence as to content and style, and therefore errs—if at all—in the direction of an unnecessary breaking up of possible sequences.

The opening sonnets, as they stand in the volume of 1609, are addressed to a young man, apparently of good family and striking personal charms and gifts, who is urged by the poet to marry in order that he may beget children to perpetuate his qualities and so, in a sense, overcome the ravages of time and death. Many of the following sonnets apparently either refer to or are addressed to the same young gentleman, and it is possible to read every one of them, up to and including the 126th, as having reference to this person,—though many of the number, if standing by themselves, would be assumed to be addressed to beautiful women. For this reason Sonnets 1–126 are frequently called the First Series, and it is assumed that they came into the publisher's hands as a body. Moreover, the sonnets from 127 to 152 inclusive have chiefly to do with a woman, dark of complexion and dark of character, and all of these *can* be read as concerned with this theme; hence this group is frequently called the Second Series. (Sonnets 153 and 154 admittedly stand quite by themselves as mere literary exercises.) A link between the two "series" is found in the fact that Sonnets 40–42 on the one hand, and 133–136 on the other, appear to refer to the same event, namely, an intrigue between the beautiful young man and the dark woman, in which it would seem that both proved untrue to their poet friend. Sonnet 144 may be viewed as the more definite key to this triangle; it is the famous poem in which the writer speaks of having "two loves":

"The better angel is a man right fair,
The worser spirit a woman colour'd ill."

Obviously, this group of sonnets raises with peculiar interest the question which attaches in some form to most of the sonnet sequences,—how far the writer speaks literally of himself, that is autobiographically, how far conventionally or imaginatively. Students of Shakespeare's Sonnets have differed widely, sometimes bitterly, on this question, and all

possible answers to it may be found, ranging from the extreme view that the story is a wholly imaginative one, with no more reference to Shakespeare's personal life than that of Romeo or Othello, to the opposite extreme, that we have in his Sonnets a perfectly clear and definite record of his friendship for an attractive but faithless young man and a repulsive yet strangely fascinating woman. The interpreters of the latter sort have also made strenuous efforts to identify the persons concerned; a number of them, in particular, having determined that the young man friend is Henry Wriothesley, Earl of Southampton, others being equally certain that he is William Herbert, Earl of Pembroke. The dispute is complicated by the curious circumstance that the publisher of the Sonnets dedicated them to a "Mr. W.H.," whom he called their "only begetter," and it has been assumed that this should give a clue to the person addressed in the "First Series." All these matters are still in debate, and there is no reason to expect any unquestioned solution. In general, modern criticism tends to agree on the view that a good part of these sonnets, including those concerned with the intrigue with the dark woman, were of definite personal significance (chiefly because, if Shakespeare had set out to tell an imaginative tale, he would have done it better and more clearly than he has told this one), but at the same time that they represent conventional moods and manners familiar to Shakespeare's contemporaries, and are therefore not to be taken so seriously by students of his life as many have done. It is certain that none of the attempted identifications has been proved.

The disputes concerning the arrangement and the biographic significance of the Sonnets have tended to obscure the question of their poetic qualities. In general, here as with Renaissance poetry as a whole, it is necessary to distinguish between qualities peculiar to that age and those of permanently vital character. Chief among the former group is Shakespeare's use of the "conceit,"—that is, the ingenious elaboration of a verbal or imaginative figure,—a habit common to most of the Renaissance lyrists, and consonant with Shakespeare's taste, especially in his more immature periods. Notable examples of this are to be found in Sonnets 8, 24, 43, 46–47, 99, 132, 135–136 and 145. As a lyrical method this is of course opposed to the canons of modern taste, and in the 18th century, when criticism was disposed to deal with special severity with Renaissance ingenuities, the poems of Shakespeare suffered a corresponding depreciation; Steevens, one of the leading editors of the plays, refused to admit them to his edition of the Works of Shakespeare, saying that no Act of Parliament would compel readers for the Sonnets. On the other hand, it is now universally admitted that in many of these sonnets we have unsurpassed examples of the power of lyrical poetry to express personal feeling in concentrated form. In particular, they deal with the theme of the struggle of human love and beauty against the arch-enemies Time and Death—now representing these enemies as triumphant, now finding in poetry a means of overcoming them, but chiefly finding such a means in the unconquerable power of love.

From this standpoint Sonnet 116 may be viewed as the climax of the collection:

"Love alters not with his brief hours and weeks,
But bears it out even to the edge of doom."

Other sonnets of importance for their content or lyrical beauty are 18, 29, 30, 31, 52, 55, 60, 64, 71, 73, 74, 90, 97, 102, 106, 129, 146.

The most extensive discussion of the Sonnets, for the general reader, is found in Sidney Lee's 'Life of Shakespeare'; it represents a rather extreme position on behalf of the conventional as distinguished from the personal interpretation. Among the convenient editions are those of Beeching (1904), Walsh (1908), Rolfe (1905), and that in the 'Tudor Shakespeare' (1913); for criticism, see the introductions in all these. The original text of the Sonnets is reproduced in the edition in the 'First Folio Shakespeare' (1912); and a complete apparatus, including the history of the criticism of the Sonnets, is in the variorum edition of R. M. Alden (1916).

RAYMOND M. ALDEN,
Professor of English, Leland Stanford
University.

SHAKTAS. See RELIGIOUS SECTS.

SHALE, a sedimentary rock made up largely of compacted clay with admixture of other finely ground rock material, and splitting into thin layers parallel to the bedding plane. In the typical shales the rock splits with a conchoidal or shelly fracture, the surface being marked by wide shallow depressions rather than by absolute smoothness. In composition, shales may be purely argillaceous, but they are generally more or less silicious, calcareous, ferruginous or carbonaceous, according to the material admixed with the clay. The carbonaceous shales are often used for the manufacture of oil or gas, some of them being so rich in carbon as to burn with a bright flame. These are called oil shales, or kerosene shales. Alum shales are clay shales rich in iron pyrites which on decomposing permits the formation of sulphuric acid, which in turn reacts upon the clay shale with the formation of alum. Calcareous shales are largely used in the manufacture of Portland cement.

SHALER, shā'ler, Alexander, American soldier: b. Haddam, Conn., 19 March 1827; d. 1911. He was educated in private schools and graduated from Brainard Academy in 1844. In 1845 he joined the Washington Grays (later known as Eighth regiment New York State militia) and transferred to the Seventh regiment in 1848, becoming major of that regiment in 1860. He was commissioned lieutenant-colonel of the 65th New York Volunteers on the outbreak of the Civil War, and became colonel in 1862, commanding the military prison at Johnson's Island, Ohio, during the winter of 1863-64. He served with the Army of the Potomac, participating in all its battles, until 6 May 1864, when he was taken prisoner at the battle of the Wilderness, and was held in Charleston, S. C., during the summer of that year. After his exchange he commanded a division in the Seventh corps and the post of Duval's Bluffs, Ark., serving in the Southwest until he was mustered out 24 Aug. 1865. He was commissioned brigadier-general of volunteers in 1863, and brevetted

major-general of volunteers in 1865. From 1867 until 1870 he was president of the board of commissioners of the Metropolitan fire department, and commissioner of the fire department of New York 1870-73. He was consulting engineer to the Chicago board of police and fire 1874-75, being charged with the reorganization and instruction of the fire department of that city. From 1867 till 1886 he was major-general of the first division of the National Guard of the State of New York, and was an organizer and president of the National Rifle Association of the United States. While a member of the board for the purchase of sites for armories he was accused of bribery, but although he was tried twice the jury disagreed each time. General Shaler published a 'Manual of Arms for Light Infantry Using the Rifle Musket' (New York 1861).

SHALER, Nathaniel Southgate, American geologist: b. Newport, Ky., 20 Feb. 1841; d. Cambridge, Mass., 10 April 1906. He was graduated from the Lawrence Scientific School, Harvard, in 1862, served in the Union army as an artillery officer, and then returned to the Lawrence School, where he was assistant and instructor in geology and zoology. He accepted the chair of palæontology at Harvard in 1868, was transferred in 1887 to that of geology, and he was dean of the Lawrence School from 1891. In 1873-80 he was in charge of the Kentucky geological survey, and from 1884 was director of the Atlantic division of the United States geological survey. He was commissioner of agriculture for the State of Massachusetts at different times, was president of the Geological Society of America in 1895; and besides numerous reports for the United States geological survey published 'Kentucky Geological Reports and Memoirs' (7 vols., 1876-82); 'The Story of Our Continent' (1892); 'The Interpretation of Nature' (1893); 'The United States of America' (2 vols., 1894); 'The Individual: Study of Life and Death' (1900); 'The Citizen: A Study of the Individual and the Government' (1904); 'The Neighbor' (1904); 'Man and the Earth' (1905). Consult 'The Autobiography of Nathaniel Southgate Shaler,' with a memoir by his wife (New York 1909), etc.

SHALLOON, a light woolen textile said to derive its name from Châlons in France, where it was originally manufactured.

SHALLOP, a light fishing-vessel with two masts and carrying lug or fore-and-aft sails; also a small boat for one or two oarsmen.

SHALLOT, or **ESCHALLOT**, a perennial bulbous plant (*Allium ascalonicum*) of the order *Liliaceæ*. The bulbs are seldom two inches long and an inch in diameter. They send up hollow small leaves which are often used for mixing with salads and dressings, or are eaten alone. The bulbs are also similarly used. They are planted in early spring in rich soil about four inches apart, in rows 15 to 18 inches apart, and kept cleanly cultivated throughout the season. The leaves may be cut at any time and the bulbs taken up in autumn, dried like onions or garlic, and kept in a dry, cool place. From two to six bulbs are usually produced by each bulb planted. In the South they are generally planted in the autumn and even in the North they may be left in the

ground over winter. They are less grown in the United States than in Europe.

SHALMANESER, *shāl-mā-nē'zēr*, third of his name, the Assyrian king, who in 853 B.C. defeated Benhadad with his ally, Ahab, king of Israel, at Karkar, the Biblical Kir-haraseth (2 Kings iii, 25), on the Orontes. Shalmaneser did not gain a decisive victory over his foes, as he was unable to proceed to Damascus and to wage war against his other enemies; he was worsted in battle by the Chaldeans of Armenia. See **AHAB ASSYRIA**.

SHAMANISM, a vague term used by explorers of Siberia in the 18th and 19th centuries to designate not a specific religion but a form of savage magic or science, by which physical nature was believed to be brought under the control of man. It prevails among Turanian and Mongolian tribes and American Indians, and blends with their varied religious beliefs and customs. Shamanism rests for its basis on the animistic view of nature. Animism teaches that primitive and savage man views the world as pervaded by spiritual forces. Fairies, goblins, ghosts and demons hover about him waking or sleeping; they are the cause of his mishaps, losses, pains. Mountains, woods, forests, rivers, lakes are conceived to possess spirits, and to be living, thinking, willing, passionate beings like himself. In respect to these, man is in a state of helplessness. The shaman by appropriate words and acts uses his power to shield man and envelops him in a kind of protective armor so that the evil spirits become inactive or inoffensive. His rôle is that of antagonist to the spirits and of guardian to ordinary man. The Eskimos believe all the affairs of life are under the control of malignant spirits who are everywhere. These minor spirits are subject to the great spirit *Tung-Ak*, yet must be propitiated. The shaman alone is supposed to be able to deal with the great spirit, though not superior to him. The main principle of Shamanism is the attempt to control physical nature. Hence the term embraces the various methods by which the spirits can be brought near or driven away. The belief that the shaman practises this magic art is universal among savages. To this art nothing seems impossible; it intimately affects their conduct and is reflected in their myths. In some cases initiation is required. Thus with the Navajo and Ojibwas they who have successfully passed through the four degrees of the *medéwin* are called *medé*, and are considered competent to foresee and prophesy, to cure diseases and to prolong life, to make fetishes and to aid others in attaining desires not to be realized in any other way. They who have received instruction in one or two degrees usually practise a specialty, e.g., making rain, finding game, curing diseases. For this women are eligible. Most commonly the shaman is a man. Among the Yakuts, the Carib tribes and in northern California there are female as well as male shamans; and in some cases male shamans have to assume women's dress. Every Maori warrior is a shaman. In Samoa there is no regular caste, but in other Polynesian groups the shaman is the exclusive privilege of an hereditary class of nobles. In the practice of his art the shaman

is regarded as (1) a healer, hence the term "medicine man," and the secret medicine societies of the Seneca, and of other American tribes; (2) an educator, i.e., the keeper of myth and tradition, of the arts of writing and divination; he is the repository of the tribal wisdom; (3) a civil magistrate; as seers possessing secret knowledge with power at times of assuming other shapes and of employing the souls of the dead, they are credited with ability to detect and punish crimes; (4) a war-chief; thus with the Dakotas and Cheyennes the head war-chief must be a medicine-man. Hence the shaman possesses great influence and in many cases is the real ruler of the tribe. The means which he uses are (1) symbolic magic, on the principle that association in thought must involve similar connection in reality; (2) fasting with solitude and very generally bodily cleanness and incantations usually in some ancient or unmeaning language and at times obscene; (3) dances and contortions with use of rattle and drum and a distinctive dress decked with snakes, stripes of fur, little bells. The frenzy and contortions lead to an ecstatic state which is considered of the greatest importance. In South America drugs are used to induce stupor; (4) possession; thus in Korea the *pan-su* is supposed to have power over the spirits, because he is possessed by a more powerful demon whose strength he is able to wield.

Shamanism is closely akin to fetishism, and at times it is difficult to tell whether the practices in vogue among certain peoples should be referred to the one or to the other. Both spring from Animism; both are systems of savage magic or science and have certain rites in common. Yet the differences consist in the belief that in fetishism the magic power resides in the instrument or in particular substances and passes into or acts upon the object, whereas in shamanism the will-effort of the magician is the efficient factor in compelling souls or spirits or gods to do his will, or in preventing them from doing their own. Shamanism takes for granted the theory that fear is the origin of religion. Shamanism is not a religion. The religious priest beseeches the favor of the gods; the shaman is believed to be able to compel and command them to do his will. Hence the term is not to be regarded as a name for a principal form of religion but for important phenomena and tendencies of Animism. Consult 'Reports of the Bureau of American Ethnology' (Washington, D. C., annually); Achelis, T., 'Moderne Völkerkunde' (Stuttgart 1896); id., 'Abriss der vergleichenden Religionswissenschaft' (Leipzig 1904); Frazer, J. G., 'The Golden Bough' (New York 1900-12); Müller, 'Contributions to the Science of Mythology' (London 1897); Lang, 'Myth, Ritual and Religion' (ib. 1887); Keane, 'The World's Peoples' (New York 1908); Furlong, 'The Faiths of Man' (London 1906); *Journal of American Folklore* (January 1908); Tumholtz, C., 'Unknown Mexico' (New York 1902); Tylor, 'Primitive Culture' (2d ed., New York 1889).

SHAMASH, or **ŠAMAŠ**, the sun god of Babylonia and Assyria. Inscriptions designate him as the offspring of Sin, the moon god, the moon power in the earlier, nomadic times being

the dominant deity. With the development of agriculture the importance of the sun god grew and he became one of a triad with Sin, the moon god, and Ishtar, the earth god. To Shamash were attributed powers of justice and right, evil being supposed to flee before the power of light, and he was likewise the god of healing. His wife was A, Aa, Or Ai, and in inscriptions is the "lady of mankind" and the "lady of the countries." His children were Kettu (justice) and Mesharu (right), although these are also referred to with other minor sun gods, such as Bunene, as servitors of Shamash. Ninib, the sun god of the morning and of spring, and Nergal, god of moon and summer, however, retained their powers under the headship of Shamash. The principal places of worship were Sippara, the Sepharvaim of the Bible; and Larsa, the modern Senkereh; the sanctuary in both cities being called E-barra or E-babbara, "the shining house." Other temples of his worship were built at Babylon, Ur, Nippur and Nineveh.

SHAMOKIN, shā-mō'kīn, Pa., borough in Northumberland County, on the Philadelphia and Reading and Pennsylvania railroads, about 45 miles north by east of Harrisburg, the capital of the State. It was settled in 1835 by people employed in developing the coal mines. It was incorporated as a borough in 1864. It is the industrial and commercial centre of a region rich in anthracite coal. The chief industrial establishments are foundries, machine shops, silk and knitting and planing mills, flour mills, brickyards, and a large number of the inhabitants of the borough are employed in the mines in the vicinity. The borough has an extensive trade in coal and in iron products and in knit goods. There are several churches, free high schools, public and parish schools, and a public library. The banks, national and State, have a combined capital of over \$500,000. The government is vested in a chief burgess and a council. The majority of the inhabitants are native born, but there are a number from Wales, Poland, Hungary and Germany, also from England, Ireland and Scotland. Pop. 20,985.

SHAMROCK, a name derived from the Irish *seamrog*, meaning "trefoil," and applied to various trifoliate plants native to Ireland, and even to the water-cress (which is not three-parted). Each is said to be the plant picked by Saint Patrick as a symbol to illustrate the doctrine of the Trinity. The Shamrock is worn on Saint Patrick's Day, 17th of March, and has come to be regarded as the national plant of Ireland. The black medic (*Medicago lupulina*), *Oxalis acetosella*, various clovers, such as the common red clover (*Trifolium pratense*), a trailing hop-clover, with small leaves and yellow heads (*Timinus*), and the common low, white clover (*T. repens*), are widely sold as the "true" shamrock, and exported in large quantities to the United States and other countries, where Irishmen make a custom of wearing the sprays on Saint Patrick's day as a reminder of home associations.

SHAN-HAI-KWAN, shān-hī-kwān, China, a town in the province of Chi-li, situated on the Gulf of Liao-tung, on the Manchurian boundary, and at the point where the Great Wall

reaches the sea. It is a station on the Northern Railroad, and a point of great strategic importance. Being a Chinese garrison town, it was occupied during the Boxer troubles of 1901 by troops of the allied Powers. It consists of the inner town devoted to trade, the eastern town, which is occupied by officials and troops, and the western town which is occupied by tradespeople and troops. It has large railroad repair shops. Pop. 30,000.

SHAN-SI, shān-sē, China, an inland northern province, bounded east by Chi-li and Henan, south by Hu-nan, west by Shen-si, and north by Mongolia and the Great Wall; area, 81,830 square miles. Its rugged surface contrasts strikingly with the level tracts in some of the surrounding provinces, although the lowland parts of it are represented as being well cultivated and terraced. The rivers, which are almost all tributaries of the Hwang-ho or Yellow River, are numerous, but not large. The Fen-ho, the largest of these streams, is about 300 miles long and falls into the Yellow River near the southwest corner of the province, after draining the central part. The north contains some of the favorite hunting grounds of the wealthier Chinese, and the inhabitants find sources of wealth in the coal, iron, cinnabar, copper, marble, lapislazuli, jasper, salt and other minerals, which it affords. The principal grains are wheat and millet, besides a great variety of vegetables, with grapes and other fruits. Tobacco is cultivated in the southern half of the province. Besides Tai-yuan, the capital, there are several populous towns in the province. This province is the original seat of the Chinese people and many of the events recorded in their ancient annals occurred within its borders. Pop. 12,200,500.

SHAN (shān) **STATES**, Indo-China, a series of petty states on the east of Burma and north of Siam, occupying an area not well defined. The northern part of the Shan country comprises the North and South Shan states, belonging to British Burma, and the southern part, the Laos or Siamese Shan states belonging to Siam. The Shans are descendants of an aboriginal race from the mountains on the western borders of China and are closely allied to the Laos and the Siamese. They are an indolent, laughter-loving people, fond of gambling and cock-fighting, not unwarlike, though orderly and fairly trustworthy; the women have great influence and enjoy equal freedom with the men. Slavery, however, exists, but in a mild form, and serfdom is general. While the chief employment is agriculture, there are noted manufacturers of chased work in gold and silver. The rule of the native chiefs is generally just and mild, and taxation is light. Buddhism is the dominant religion, though it is mingled with many superstitious practices. See LAOS; LOLOS and SIAM.

SHAN-TUNG, shān-toong', China, a northern maritime province bounded north and west by Chi-li, southwest by the Gulf of Pe-chi-li and the Yellow Sea, and south by Kiang-su and Hu-nan; area, 55,970 square miles. The climate is very bracing; the rainfall extends from April to September. The greater portion of this province is level, but the peninsular parts of it are hilly. The shores are generally bold and full of indentations, some of which

are excellent harbors. Wei-hai-wei leased to the British, Kiao-chau, formerly leased to Germany, and the native towns Teng-chau and Chi-fu are the only important seaport towns along the entire coast. The province is intersected by several rivers. The only large one flowing direct to the sea is the Yellow River or Hwang-ho, which, after traversing the province in a northeast direction, flows into the Gulf of Pe-chi-li. The inland navigation is augmented by the grand canal which traverses the west part of the province northwest to southeast, affording great trading advantages, and the transit trade is extensive. Drugs and vast quantities of vegetables are exported, and felt caps, carpets and some coarse hempen cloths are manufactured. Pongee silk and straw-braid are exported in large quantities. The province is over-peopled, and the great proportion of the people are poor; still they appear to be contented and attach peculiar importance to this province, on account of its being the birthplace of Confucius and his disciple, Mencius, and also because it contains the Tai-shan, or Great Mount, which forms a favorite resort of devotees from amazing distances. Its capital is Tsi-nan. Pop. 25,810,000.

By a convention signed 6 March 1898 Germany obtained the so-called Kiao-Chau concession, giving her special privileges in a belt 33 miles wide running around Kiao-Chau Bay, which included the right to move troops, but with the specification that the territory in this zone was still under Chinese sovereignty. It also gave to Germany the Treaty Port of Tsing-tao where fortifications were erected and the Germans enjoyed extraterritorial immunity from Chinese interference. It also conferred the right to grant concessions for two railways in Shantung province (afterward extended) and a railway zone 20 miles wide in which mining operations could be carried on under German direction and by German capital. Under the terms of this treaty Tsing-tao was built and fortified, the Tsing-tao-Tsinan Railway was constructed and mining operations were started. Shantung was looked upon as Germany's sphere of influence. In 1914 Japan declared war upon Germany and announced that she would support Great Britain's interests by taking Tsing-tao. Yuan Shih-kai offered to bring China in as an ally and take it but was dissuaded. A Japanese fleet blockaded the German treaty port, supported by British and French vessels and a Japanese military force approached Tsing-tao overland from Lungkow and with a small British contingent, besieged it. After a short struggle the Germans surrendered and the Japanese expeditionary force occupied the place. In 1915 21 demands were presented to China, secretly, and were discussed in conferences, at which the Japanese permitted no minutes to be taken. The Chinese were forced to agree that they would abide by any decision reached between Japan and Germany at the Peace Conference. In 1917 before America and China entered the war, Japan extracted from Great Britain, and later from France and Italy, a pledge that she would be supported in her claim upon Tsing-tao at the Peace Conference. Already in 1914 Japan had announced that she proposed to return Kiao-Chau to China with full sovereignty.

The entry of China in the war against Germany completely altered the status of the Shantung question, of which the disposition now clearly was a question between China and Germany and not as before between Germany and Japan. The latter apparently saw the weakness of her position and in September 1918 negotiated a secret agreement with Tsao Ju-lin, who acted without the knowledge of Parliament or the Cabinet. By this agreement Japan came into possession of Germany's former claim upon projected Shantung railways. This was the status of the Shantung question when the Peace Conference began its sessions in Paris. Japan was armed with five treaties and agreements. Faced with these documents the representatives of the great nations at the Conference, instead of ignoring or tearing up the documents, gave Japan's claims the following consideration in the final draft of the terms submitted to Germany:

"Germany cedes to Japan all rights, titles, and privileges, notably as to Kiao-Chau, and the railroads, mines and cables acquired by her treaty with China of 6 March 1898, and by other agreements as to Shantung.

"All German rights to the railroad from Tsing-tao to Tsinanfu, including all facilities and mining rights and rights of exploitation, pass equally to Japan and the cables from Tsing-tao to Shanghai and Chefoo, the cables free of all charges; all German state property, movable and immovable, in Kiao-Chau is acquired by Japan free of all charges."

This award to Japan aroused the Chinese nation as nothing else had done in their history. It also caused hostile comment in the United States, many Senators being reluctant to vote for the ratification of the treaty with this provision included. Japan announced once more that she would return the province to China, but no date was specified for the fulfilment of this promise. See WAR, EUROPEAN — PEACE CONFERENCE.

SHANGHAI, shāng-hī', China, a seaport city, the most important of the Chinese treaty ports, one of the five opened to foreign commerce in 1843, in the province of Kiang-su, near the junction of the Hwang-pu and the Wu-sung rivers, 12 miles from the mouth of the Yang-tse-kiang and 150 miles southeast of Nanking. Old Shanghai, or the Chinese city, is surrounded by a wall 24 feet high, pierced by six gates and enclosing an area of about two square miles. The streets are narrow and dirty and the buildings, low and crowded; modern sanitation and other improvements are being introduced gradually. The principal buildings are the Wei-Kwan, a commercial tribunal; a temple dedicated to the goddess of the seas; the Hall of Benevolence and other charitable institutions; a medical college, and the city prison. The foreign settlement is quite distinct in its boundaries, government and commerce. It stands on the left bank of the Hwang-pu, below the walled city from which it is separated by a moat, spanned by several bridges. Two creeks divide the settlement into three sections, the upper being the French concession; the central, the British, and the lower, the American. They are held at a low rental from the Chinese government under a code of regulations drawn up by the treaty powers.

The British section is the most valuable, and the consulates of all the other nations are situated there, except the French and American. A

municipal council is elected by the foreign renters of the English and American quarters, and another by the French, whose quarter is separately administered. The subjects and citizens of each nationality are under the protection of their respective consuls and amenable to the jurisdiction of their courts; or, where the person has no consul to appeal to, he is amenable to the Chinese authorities. Chinese in foreign employ are exempt from imperial jurisdiction. Great improvements have recently been carried out, new roads being made, larger and more substantial buildings erected, including fine villas, etc.

Along the bank of the Hwang-pu extends a wide "bund" or quay, with a bulwark of stone and numerous stone jetties, for landing and loading cargo; while the path forms a promenade for the residents from 50 to 80 feet wide. It extends for one mile in length and contains spacious houses surrounded with gardens; the lower stories being often used as stores (godowns) and counting-houses, the upper as residences.

The chief mission establishments in China are at Shanghai. That of the London Missionary Society has a printing office for publishing religious works in Chinese, from which was issued in one year 500,000 copies of the New Testament for gratuitous distribution, or at a small charge. Connected with the mission is a hospital for the gratuitous care of native patients, under the charge of a medical missionary, where many thousands attend during the year. The American Presbyterian Mission not only print in Chinese, but manufacture the metallic types. There is an extensive mission, also, under the auspices of the French *Société de la Propagation de la Foi*, where the missionaries conform to the dress and manners of the Chinese, with an extensive establishment near the walled city, having a cathedral within its precincts, capable of accommodating 3,000 people. Besides this the French have a handsome church in their concession. In the British concession there is an English church, with several chapels and meeting-houses scattered over the other parts of the settlement. Here also is a public library and a branch of the Royal Asiatic Society. Cotton spinning and ship-building are among the chief industries of Shanghai, and there are silk filatures, flour, rice and paper mills, furniture and piano works, packing-houses, ginning factories, etc.

The port of Shanghai extends from the upper limb of the Hwang-pu, below the native shipping, to Wu-sung, a distance of 12 miles, connected by rail, and of which the anchorage for foreign vessels extends for four miles below the settlement. The anchorage is divided into sections, defining the foreign from the Chinese boundary, where all the vessels are anchored abreast and lettered according to their position, steamers being separated from sailing ships. A foreign harbor-master is appointed by the Chinese authorities, who retain complete control over the conservancy of the harbor and its entrance and collect all shipping dues, duties on imports and exports, etc., through the foreign maritime customs. Shanghai has water communication with about a third of China and its trade has become very extensive, the port being connected with a system of steamship lines which carry cargo and

passengers to and from all parts of the world. The largest trade is with Great Britain and her dependencies, but Japan, the United States, Germany and Russia are increasing their share. The gross value of foreign imports in 1914 was \$166,774,094, the great bulk of which represented goods re-exported to other ports. The exports to foreign countries for the same year were valued at \$103,236,774. The chief foreign imports are opium, cotton yarns and piece goods, metals, kerosene oil, coal and sugar; and the leading exports are raw silk and silk piece goods, tea, raw cotton, hides and native cloths. A considerable share of the coasting trade is in British hands, and both in the home and foreign trade steamers are chiefly employed. In 1914, 18,950,918 tons of foreign shipping entered and cleared the port, of which 40 per cent were British; besides this the native shipping entered and cleared amounted to 2,101,430 tons. Pop. 650,000; the foreign population is 13,436, of whom 4,465 are British, 3,361 Japanese, 941 American and 330 French.

SHANGHAI, a breed of fowls. See **POULTRY**.

SHANKLIN, William Arnold, American Methodist Episcopal clergyman and university president: b. Carrollton, Mo., 18 April 1862. He was graduated at Hamilton College in 1883, and took his S.T.B. at Garrett Biblical Institute in 1891. He was ordained in the Methodist Episcopal ministry in 1889, and held pastorates in Kansas, Washington, Iowa and Pennsylvania in 1887-1905. He was president of Upper Iowa University in 1905-09, and has since been president of the Wesleyan University.

SHANKS, William Franklin Gore, American journalist: b. Shelbyville, Ky., 20 April 1837; d. Hamilton, Bermuda, 22 Feb. 1905. He was a war correspondent for the *New York Herald* during the Civil War, afterward an editorial writer on that and other New York papers and was managing editor of *Harper's Weekly*, 1867-69. While city editor of the *Tribune* he was imprisoned for contempt of court for refusal to divulge the name of the writer of an article in the paper, taking the ground that he was a privileged witness. After his release he brought charges against District Attorney Winchester Britton, who was removed by Governor Dix. In 1880, he instituted suit, for the first time in the United States, against the vendor of a libel, recovering two judgments, and the Court of Appeals sustained the legal point at issue. In 1885 he organized the National Press Intelligence Company. He is the author of 'Personal Recollections of Distinguished Generals' (1865); 'A Noble Treason,' a tragedy (1876) and 'The Ring Master.'

SHANLY, Walter, Canadian railway engineer and legislator: b. Stradbally, Queen's County, Ireland, 11 Oct. 1819; d. 1901. He studied civil engineering and in 1837 emigrated to Canada. He was resident engineer of the Beauharnois and Welland canals in 1843-48; of the Northern New York Railroad in 1848-51; and chief engineer of the Ottawa and Prescott Railway in 1851-53. In 1853 he became chief engineer of the western division of the Grand Trunk Railroad and he was its general manager in 1857-62. In 1869-75 he was engaged in building the Hoosac Mountain Tunnel in Massachusetts, the greatest achievement of his career.

He was chief engineer of the Canada Atlantic Railway in 1879-85, and thereafter was its consulting engineer. He was a member of the Canadian Assembly in 1863-67, and after the confederation served in the Dominion Parliament in 1867-72 and in 1885-90.

SHANNON, shān'ōn, **Wilson**, American politician: b. Belmont County, Ohio, 24 Feb. 1802; d. Lawrence, Kan., 30 Aug. 1877. He had a collegiate and law training and began practice at St. Clairsville, Ohio. In 1832 he became attorney for Belmont County, and in 1838 Democratic governor of the State. After the interim of one term he was re-elected in 1842. During 1844-45, until the suspension of diplomatic relations, he was Minister to Mexico by appointment of President Tyler; and after his return he practised law in Cincinnati. He was elected to Congress in 1852, where he served on the committee on foreign affairs. In 1855 he was appointed by President Pierce to succeed Andrew H. Reeder as governor of Kansas. The contests of the pro- and anti-slavery factions among the people to gain possession of the legislature made the post an exceedingly onerous one, especially for one who endeavored to administer affairs impartially. He resigned in August of the following year. After the political troubles of Kansas had subsided he returned to the State to reside.

SHANNON, a river in Ireland, the largest in the United Kingdom; rises at the foot of the Cuilcagh Mountains, in the northwest of County Cavan, flows west, southwest, through Lough Allen, then takes an irregular course, generally south, to Lough Rea, then southwest to Lough Derg, then south to Limerick where it becomes a tidal stream. From here on to its mouth are several expansions and it enters the ocean by a broad estuary. The various lakes through which it passes are in part real lake basins and partly river expansions. The total length is 254 miles. By means of improvements which cost about \$5,000,000, the river has been made navigable from Lough Allen to Limerick, and the Grand and Royal canals, which connect the river with Dublin, have increased its commercial importance. Vessels of 1,000 tons ascend it as far as Limerick, and vessels of lighter draught as far as Athlone. Consult Harvey 'The Shannon and Its Lakes' (London 1896).

SHANNON, **The**. See **CHESAPEAKE AND SHANNON**, **BATTLE OF**.

SHARI, shā'rē, a large river in Central Africa, which enters the south side of Lake Tchad by several mouths after a course of about 700 miles from the southeast. It drains Central Sudan and in its lower course marks the boundary between Bagirmi and Cameroon. It is navigable to Gulfei. See **TCHAD**, **LAKE**.

SHARKS, an extensive group of elasmobranch fishes of the order *Selachii*, in which the claspers are complex in structure and the pectoral fins supported on the shoulder-girdle by three basal axial cartilages which may be more or less subdivided, and which bear the cartilaginous fin rays chiefly or exclusively on one side. The external parts of the fins are supported by delicate horn-fibres or actinotrichia. From the rays and skates the sharks are distinguished by the position of the branchial clefts, which are always lateral, by the fan-shaped pectoral fins, and by the shape of the body, which is almost

always elongated, rounded and tapering to the strongly heterocercal tail.

The sharks breathe by gill-sacs or pouches, which open externally on the neck by gill-slits, of which there are five to seven pairs. Water may also be admitted to the gills through the spiracles, a pair of openings on the upper side of the head representing an anterior pair of gill-slits which are never large and often absent. The mouth exists on the under surface of the head, a conformation compelling some of these fishes to turn on their backs to bite conveniently objects at the surface. The skin is usually provided with small tooth-like granules in the form of placoid scales; and is used under the name of *shagreen*, in the manufacture of various articles, such as purses, spectacle-cases, or as a substitute for sandpaper. The eggs may be laid in capsules or cases of horny material, within which the embryos are protected, the egg-cases being moored or fastened by filaments to rocks or fixed objects, and the young form escaping in due time from its covering. The egg-cases of dog-fishes are frequently cast up on the shores, and receive the fanciful or popular name of "mermaids'-purses," "sea-purses," and the like. The majority of the sharks are, however, viviparous and in some the embryos are nourished by means of placenta-like structures. The skeleton never attains a high degree of perfection, but is chiefly cartilaginous. The skull exhibits no indications of divisions into distinct cranial bones, although the jaws are well developed and calcified. The intestine is provided with a spiral valve which serves to increase the area over which the food has to pass, and the base of the aorta contains rows of valves.

The species of sharks are numerous and so varied in structure that the living forms alone have been arranged in about 20 families. With the single exception of *Eulamia nicaraguensis*, which inhabits lake Nicaragua, all are marine, only a few occasionally entering the large rivers of India. Owing to their active, roving habits, most of them are widely distributed. With perhaps half a dozen exceptions all sharks are strictly carnivorous and predaceous, and because of their ferocity several of the large species are justly feared. A few of the most noteworthy species are the following:

Species of Sharks.—The white shark or man-eater (*Carcharodon carcharias*) is white below and brown on the upper parts. It is probably the best known of the sharks, and is found in most seas. (See **MAN-EATER**). The blue shark (*Carcharinus glaucus*), also known as man-eater, is slaty-blue on the upper, and white on the under parts. It may attain a length of 20 feet or more, and is exceedingly destructive to shoals of food-fishes, pursuing its prey even into the fishermen's nets. Both of these occur occasionally on our coasts, where the dusky shark (*C. obscurus*) closely related to the last, but smaller, is very common. The thresher shark (*Alopias vulpes*), is known by the exceedingly elongated upper tail-lobe, which the fish uses after the fashion of a powerful flail when it attacks a school of fish. It feeds chiefly on fishes, and occasionally visits our coasts. The average length varies from 12 to 15 feet. A very common small species along the Atlantic Coast is the sand shark (*Carcharias littoralis*), which has very acute teeth mostly provided at the base with one or two cusps. The

hammer-headed shark (q.v.) is at once recognized by the lateral elongation of the head to form a hammer-like structure. The porbeagle shark (*Lamna cornubica*) may attain a length of six feet, and is grayish-black. It has slender, very acute teeth and is quite a common visitor to our coasts, where it is also known as the mackerel-shark. The basking-shark (*Cetorhinus maximus*) attains a length of from 30 to 36 feet, being the largest of all sharks, and is found around our coasts but is chiefly an Arctic species. The name is derived from its habit of lying motionless on the surface of the water in the sun, often in schools. It is sluggish and, in spite of its huge size, harmless and feeds on fish. The head and teeth are small, the dorsal fin very large and the gill-slits long. The Greenland, northern, or sleeper shark (*Somniosus microcephalus*) attains a length of 18 feet, and is brown, shaded with deep blue. It feeds upon the carcasses of whales, even attacks living whales, and is chiefly found in the Arctic seas. The spinous shark (*Echinorhinus spinosus*) is so named from the presence of the spiny scales scattered over its integument. The average length is seven or eight feet. It is common on the Atlantic coasts of Europe and Africa, and has been taken once on Cape Cod.

Of the dog-fishes (q.v.) may be mentioned the smooth dog (*Galeus canis*), and the picked dog-fish (*Squalus acanthias*). Two very remarkable sharks representing groups now nearly extinct are the Port Jackson shark (see CESTRACION) and the frilled shark (*Chlamydose-lache anguineus*). The former is remarkable for the pavement-like teeth and stout fin-spines and the latter for its eel-shaped body, diphy-cercal tail, frilled gill-clefts and prominently lobed teeth. The former occurs in Australian, the latter in Japanese waters. Another very recent discovery in the latter region is *Mitsukurina owstoni*, unique among living sharks in its prolonged snout and protruding mouth. The sawsharks (*Pristiophoridae*), which bear a doubly serrate process on the snout like the saw-fishes (q.v.), are otherwise shark-like; and the angel-sharks (*Squatinae*), with much flattened bodies, lead to the skates and rays.

The varieties of extinct sharks are still more numerous and vary from the delicate little acanthodians, only a few inches long, of the Carboniferous, to the huge Tertiary carcharodons, whose five-inch teeth indicate a length of 75 feet. Many of the Palæozoic sharks were of types very different from any now living.

Usefulness.—The liver of some sharks contains a large quantity of oil, and they are accordingly caught in great numbers in some places, and the oil extracted. Shark-fishing constitutes an industry of some importance on the coast of Russian Lapland and the northern portion of Norway. Those caught here are chiefly the basking shark and the Greenland shark. The Norwegians employ decked vessels of 20 to 30 tons burden, which carry on the fishery as much as 100 or 150 miles from land, at depths of 250 to 300 fathoms. These vessels carry five or six men. On the coast of Norway, farther to the south, other species of sharks are also caught. In order to attract the sharks the fishermen take an old barrel pierced with several holes, pour oil or grease into it and sink it to the bottom with stones. The oil or grease

escapes slowly, and is carried by the currents to a distance, thus attracting the keen-scented fishes to the place where the boat is stationed. Here they are caught by hooks baited with salted seal's flesh and fastened to the end of strong chains. When a shark is hooked three of the men haul in the chain, while a fourth stands ready with a mallet, weighing about 20 pounds, to stun the fish when its head appears.

The fisheries of China, India and Africa, which have for their object the white shark and other large species for the purpose of supplying the sharks-fin trade of China, are also of great value, and capture annually a total of not less than 100,000 sharks. In the United States shark fisheries have never been developed extensively, practically the only one worthy of mention being the dogfish industry of New England and particularly of Maine, where the livers of the spiny or picked dogfish are tried for oil and the flesh ground into a poultry food. Dogfish oil is used by curriers and as an adulterant of cod-liver oil. In Europe the dogfish fisheries are far more extensive and, besides the oil secured from the livers, the flesh yields an extract which for nutritive properties compares favorably with extract of beef, and is generally edible and likable.

A. v., 'Textbook of Paleontology' (2 vols., trans. by Eastman, C. R., New York 1903).

SHARON, Shār'ôn, Pa., borough in Mercer County, on the Shenango River and on the Pennsylvania, the Erie and the Lake Shore and Michigan Southern railroads, about 40 miles south-southwest of Meadville and near the Ohio boundary. It is in a coal-mining and iron ore region, and its chief industries are connected with the mining and shipping of coal and of iron and steel products. The principal industrial establishments are furnaces, rolling mills, foundries, nail factories, machine shops, tile and brick works, boiler works, a brewery, a planing mill and a furniture factory. There are also manufactured a large amount of brass and steel products, explosives, spokes, stoves and lumber products. The stone quarries, in the vicinity, furnish employment to a number and contribute to the prosperity of Sharon. The principal public buildings are the business blocks, churches and schools. The educational institutions are Hall Institute (Baptist), founded in 1888, Saint Scholastica Academy (Roman Catholic), a high school, public schools, parish schools, a public school library, founded in 1877 and several private schools. Pop. 18,077.

SHARON, Palestine, in biblical geography a plain on the Mediterranean coast of the country, reaching inland to the hills and from Joppa to Cæsarea. It was originally of great fertility, with forests and rich vegetation, and is still excellent pasture ground. The beauty

of the district was generally recognized (Isaiah xxxv, 2), and its roses in the Song of Solomon (ii, 1). The herds of David are mentioned as grazing there (1 Chron. xxvii, 29).

SHARON SPRINGS, N. Y., village in Schoharie County, on the Delaware and Hudson Railroad, about 50 miles west by north of Albany. It is in a valley about 1,100 feet above the sea. It is a famous summer resort on account of its picturesque location and its four noted mineral springs, a white sulphur, blue sulphur, a magnesia and a chalybeate. It was incorporated in 1871. Pop. about 800; in the summer season, about 10,000.

SHARP, Abraham, English mathematician: b. Little Horton, 1651; d. Yorkshire, 15 July 1742. Having studied and taught mathematics in Liverpool, he was employed by John Flamsteed in the Greenwich Observatory and made for him, in 1688-89, Flamsteed's first successful instrument, a mural arc. Afterward he taught mathematics in London and subsequently retired to Little Horton, where he devoted himself to mathematics and to making astronomical and calculation instruments, and is said to have been the first Englishman to make these accurately. He published a book of logarithms, the first of its kind, was a joint author with Crowthait of 'The British Catalogue' and plotted a number of important astronomical maps. Consult Cudworth, W., 'Life and Correspondence of Abraham Sharp' (Bradford 1889).

SHARP, Becky, the leading character in Thackeray's novel, 'Vanity Fair' (1847). In the notes contributed by Thackeray's daughter, Mrs. Ritchie, to the 'Biographical Edition' of Thackeray's works, she makes the statement that she once saw the lady who was supposed to have unconsciously sat for the portrait of Rebecca Sharp. Literary gossip contains a story, current for a time, that Becky was the portrait of Charlotte Brontë and that Miss Brontë retaliated by drawing Thackeray as Rochester in 'Jane Eyre.' The character has been incorporated into a drama by J. M. Barrie in 1893; by Langdon Mitchell and by Robert Hitchens and Cosmo Gordon Lennox in 1901.

SHARP, Dallas Lore, American author and educator: b. Haleyville, N. J., 13 Dec. 1870. He was graduated at Brown University in 1895 and at the Boston University School of Theology in 1899. He was ordained in the Methodist Episcopal ministry in 1895 and held pastorates in Massachusetts in 1896-99. He has been associated with the faculty of the Boston University since 1899 and since 1909 has been professor of English there. He was associate editor of the *Youth's Companion* in 1902-03. Author of 'Wild Life Near Home' (1901); 'The Lay of the Land' (1908); 'The Face of the Fields' (1911); 'Where Rolls the Oregon' (1914); 'The Hills of Hingham' (1916), etc.

SHARP, Granville, English abolitionist: b. Durham, 10 Nov. 1735; d. London, 6 July 1813. He studied law, but abandoned it to accept a place in the ordnance office. He was the patron of the slave Somerset, whom he found in the streets of London in 1769, having been turned away by his master because of illness. Sharp placed him in a hospital, and on his recovery procured employment for him. Two

years later Somerset was claimed by his master, arrested and imprisoned, whereupon Sharp summoned them both before the lord mayor, who discharged the slave. The master still refusing to release him, Sharp brought the case before the court of the King's Bench, which resulted in the famous decision against the legality of slavery in England in 1772. In 1777 he resigned from the ordnance office because of his disapproval of the American War, and devoted himself thereafter to philanthropy, particularly to the overthrow of slavery. He was chairman of the meeting which in 1787 formed the Association for the Abolition of Slavery and was one of the founders of the Negro colony at Sierra Leone. He was also an advocate of parliamentary reform, opposed dueling and favored the extension of privileges to Ireland. He wrote 61 pamphlets in reference to the causes to which he devoted his life, among which are 'Representation of the Dangerous Tendency of Tolerating Slavery in England' (1772); 'Treatise on Duelling'; 'Account of the English Polity of Congregational Courts' (1786), etc. His biography was written by Prince Hoare (London 1820) and by Charles Stuart (1836).

SHARP, James, Scottish ecclesiastic: b. Castle of Banff, 4 May 1613; d. Magus Muir, Saint Andrews, 3 May 1679. He was educated at the University of Aberdeen and was appointed regent there, where his conduct won him the friendship of the clergy. He held a professorship in Saint Leonard's College, Saint Andrews, and was then appointed Minister at Crail, Fifeshire. In 1656 he was a representative from the Presbytery to Cromwell, and he managed this mission so well that he was sent in 1660 to Monk and to Charles II. He treacherously agreed to help Monk restore Episcopacy in Scotland, but the time for this coup not being ripe he played the double part of friend to his constituents and tool of Monk. When Parliament established Episcopacy in 1661 Sharp benefited from both parties, being appointed professor of theology in Saint Mary's College, Saint Andrews and king's chaplain for Scotland. He now completely went over to the king's party, was consecrated archbishop of Saint Andrews and primate of Scotland. In 1663 he secured the establishment of a high court commission, in which he took precedence of the chancellor, and the odious persecutions of the Resolutioners by this court, especially the cruelties it inflicted after the uprising in Pentland, made Sharp an object of intense hatred throughout the country, a hatred shared by the king and court, whose tool he was regarded. Falling by accident into the hands of a party of his enemies in 1679, he was dragged from the coach in which he was riding with his daughter and was beaten to death. Consult Dodds, James, 'Fifty Years' Struggle of the Scottish Covenant' (London 1860); Stephen, Thomas, 'Life and Times of Archbishop Sharp' (ib. 1839); 'The Lauderdale Papers' (Camden Society Publications, ib. 1885).

SHARP, William, Scottish writer: b. Paisley, 12 Sept. 1856; d. Sicily, 13 Dec. 1905. He was educated at the University of Glasgow, after which he made a voyage to Australia. In 1879 he settled in London, where he knew Philip Bourke Marston and Dante Gabriel Rossetti, whose lives he later wrote. He was a

critic of art and literature and an industrious editor. In the latter capacity he projected the 'Canterbury Poets' and the 'Sonnets of the Century.' His early life in the west highlands of Scotland probably confirmed his taste for Celtic literature and among his works is a collection made with the assistance of his wife called 'Lyra Celtica.' In verse he published 'The Human Inheritance' (1882); 'Earth's Voices' (1884); 'Romantic Ballads and Poems of Fantasy' (1886); 'Sospiri di Roma' (1891); 'Flower o' the Vine' (1894); 'Sospiri d'Italia' (1904). His fiction includes 'Children of Tomorrow' (1890); 'Madge o' the Pool'; 'Wives in Exile' (1898); 'Silence Farm' (1899). He wrote, also, the biographies of Shelley, Heine and Browning and 'Literary Essays'; 'Greek Studies' (1903-04). Two volumes of his critical work appeared in 1912 and in 1909-11 appeared a complete edition of his works (7 vols.). Consult the 'Memoir' by his wife, Elizabeth A. Sharp (2 vols., London 1912). See MACLEOD, FIONA.

SHARP-SHIN, a small hen-hawk (q.v.).

SHARP-SHOOTERS, the name formerly given to the best shots of a company, who were armed with rifles and took aim in firing. They are superseded by the better arms and more complete organization of modern armies. According to the United States army regulations, a sharpshooter is a grade of rifleman next below that of expert rifleman. He wears a silver badge, consisting of a pin and cross, on the left breast of the coat. Consult 'Small Arms Firing Manual, United States Army.'

SHARP-TAILED GROUSE, the northern prairie-chicken (q.v.), a grouse (*Pediæetes phasianellus*), which has the general habits of the pinnated grouse, but differs among other features in lacking the neck-tufts, in the characteristic form of the tail, in which the central pair of quills are soft, parallel-edged and square-tipped, projecting an inch or two beyond the next pair. It is somewhat more fond of brushy places and flies more than does the pinnated grouse, which is steadily encroaching on its northwestern habitat.

SHARPE, Samuel, English Egyptologist, Bible translator and banker: b. London, 8 March 1799; d. there, 28 July 1881. He entered the banking business of his uncles in 1814, became a partner in 1824 and continued in business successfully until his retirement in 1861. He was deeply interested in archæological research and published many works on Egyptology, as well as making translations of the Bible which were characterized by a nice discrimination. Author of 'The Early History of Egypt' (1836); 'Egyptian Inscriptions' (1837); 'Vocabulary of Egyptian Hieroglyphics' (1837); 'The History of Egypt Under the Ptolomies' (1838); 'The New Testament Translated' (1840); 'The History of Egypt from the Earliest Times till A.D. 640' (1846); 'The Hebrew Scriptures Translated' (1865); 'A Short Hebrew Grammar Without Points' (1877); 'Inquiry into the Age of the Moabite Stone' (1879), etc.

SHARPLES, shär'p'lz, **Stephen Paschall**, American chemist: b. West Chester, Pa., 21 April 1842. He was graduated at Harvard in 1866, and in 1875-93 was professor of chemistry at the Boston Dental College. He has

been a consulting chemist since 1872, and in 1885-1902 he was inspector and assayer of liquors for Massachusetts. He is the editor of the *Genealogical Magazine*. Author of 'Chemical Tables' (1866).

SHARPLESS, Isaac, American educator: b. Chester County, Pa., 16 Dec. 1848. He was graduated from the Lawrence Scientific School, Harvard, in 1873, was instructor in mathematics at Haverford College in 1875-79, occupied the chair of mathematics and astronomy there in 1879-85, was dean in 1885-87 and has since been president of the college. He has written textbooks of astronomy and geometry and also published 'English Education' (in International Education Series, 1892); 'A Quaker Experiment in Government' (1898); 'Two Centuries of Pennsylvania History' (1900); 'The American College' (1915), etc. He has received honorary degrees as follows: Sc.D. from University of Pennsylvania, L.H.D. from Hobart College, LL.D. from Swarthmore College and from Harvard University. He is a member of the council of the Historical Society of Pennsylvania.

SHARPLESS, James, American artist: b. England, 1751; d. New York, 26 Feb. 1811. He began his artistic career in the United States in 1794 with a series of pastel portraits for which some of the most eminent men of the day gave him sittings, and there are still extant by him portraits of Washington, Jefferson, Hamilton, Monroe, De Witt Clinton, Burr, etc. These are treasured in the National Museum at Philadelphia, where they were placed, 40 in all, in 1876. He was also interested in mechanics and in the first volume of the 'Medical and Philosophical Register' (1811) is a paper by him on steam-carriages. He is buried in the churchyard of Saint Peter's, Barclay street, New York.

SHARPS, Christian, American inventor: b. New Jersey, 1811; d. Vernon, Conn., 13 March 1874. He developed a taste for mechanics at an early age and practically devoted his life to invention. He was the originator of many ingenious implements, but none of these gave him such fame and remuneration as the breech-loading rifle which bears his name. In 1854 he removed to Hartford, Conn., to superintend the manufacture of this rifle, and he subsequently invented other firearms of great value and patented many ingenious implements of various kinds.

SHARPSBURG, Md., a village in Washington County, beautifully situated in a narrow valley, 12 miles south of Hagerstown, about the same distance north of Harper's Ferry and three miles east of Shepherdstown, on the Potomac. It has no manufactures, but is surrounded by a fine farming country, the chief products of which are corn, wheat, hay, apples, peaches and other fruits. It is chiefly noted as the scene of the battle of Antietam (q.v.) or Sharpsburg, fought on the outskirts of the village, 17 Sept. 1862, in which more men were killed and wounded than on any other day of the Civil War. Pop. 1,100.

SHARPSBURG, Pa., borough in Allegheny County, on the Allegheny River and on the Pittsburgh and Cincinnati, Chicago and Saint Louis and the Pennsylvania railroads, six miles northeast of Pittsburgh. It is in a coal-mining

region. The chief industrial establishments are foundries, blast furnaces, rolling mills, machine shops, bottle works, planing mills, hair, felt and lubricating oil works, wire and brick works. Other manufactures are oil cans, varnish and japan, chemicals, coal-mining tools and oil-well machinery. It has large coal yards and exports annually a large amount of coal and of steel and iron products. It has a high school, public and parish elementary schools and a public library. Pop. 8,843.

SHARPSBURG (Md.), Battle of. See **ANTIETAM, BATTLE OF**.

SHARPSHOOTER, popular name in southern United States for any of several hemipterous insects which puncture the immature cotton bolls, causing them to wilt or rot. Of these the *Homalodisca coagulata* is the most common. The Mexican boll-weevil is likewise known by the name in some parts of Texas.

SHARSWOOD, shārz'wūd, **George**, American jurist: b. Philadelphia, Pa., 7 July 1810; d. there, 28 May 1883. He was graduated at the University of Pennsylvania in 1828 and was admitted to the bar in 1831. He served in the State legislature in 1837-38 and in 1842-43, and in 1845 was appointed judge of the District Court of Philadelphia, becoming president of that court in 1848. In 1848 he was appointed to the bench of the Supreme Court of Pennsylvania, of which he was chief justice from 1878 until he retired in 1882. He ranked as one of the most eminent jurists in the State. He was professor of law at the University of Pennsylvania in 1850-67. He brought out editions of many English law textbooks, of which the most famous was 'Sharswood's Blackstone's Commentaries' (1859). He was author of 'Professional Ethics' (1854); 'Popular Lectures on Common Law' (1856); 'Lectures on Commercial Law' (1859), etc.

SHASTA, Mount, a peak of the Sierra Nevada range in Siskiyou County in California. It is of volcanic origin, about 14,350 feet above sea-level, and on its summit are three glaciers, one of which, Whitney, is three miles long. On the slope and near the base are large trees, some 300 feet high. The mountain is conical in form and has been a dormant volcano for a long period. Consult Muir, 'The Mountains of California' (New York 1911).

SHASTA (shās'ta) **INDIANS**, probably from *tsasdi*, "three," referring to a triple-peak mountain. A group of small tribes forming the Sastean linguistic stock of American Indians, formerly occupying the territory drained by Klamath River and its tributaries from the western base of the Cascade range to the point where the Klamath flows through a ridge of hills east of Happy Camp, in northern California and extending over the Siskiyou Mountains in Oregon as far as the confluence of Stewart and Rogue Rivers. They consisted of two divisions, marked by slightly divergent dialects, one comprising the Iruwaitzu, Kammatwa and Kikatsik; the other the Chimelakwc and Katiru. They have practically lost their native customs through contact with civilization, but they were a sedentary people, living in rectangular, semi-subterranean plank houses, and subsisting chiefly on salmon and other fish, acorns, roots and seeds. They made basket

caps (which the women wore), as well as small food baskets and a rude form of dug-out canoe. They rapidly succumbed to the encroachments of civilization, and while the tribes composing the stock were never populous, their total number at present is about 1,500, most of whom are on the Siletz Reservation in Oregon. Mount Shasta derives its name from these Indians. Consult Dixon, R. B., 'The Shasta' (in American Museum of Natural History *Bulletin*, Vol. XVII, New York 1907).

SHATTUCK, shāt'ūk, **Frederick Cheever**, American physician, brother of G. B. Shattuck (q.v.): b. Boston, Mass., 1 Nov. 1847. He was graduated at Harvard University in 1868 and took his M.D. there in 1873. He engaged in practice in Boston in 1875, was connected with the faculty at Harvard from 1879, and from 1888 he was Jackson professor of clinical medicine there. He became professor emeritus in 1912, at the same time retiring from practice. He has been an overseer of Harvard since 1913 and is a retired lieutenant in the United States Army Medical Reserve Corps. Author of many papers in medical journals.

SHATTUCK, **George Brune**, American physician and editor: b. Boston, Mass., 18 Aug. 1844. He was graduated at Harvard in 1863 and took his M.D. there in 1869. He was engaged in practice in Boston in 1869-1911, when he retired. He edited the *Boston Medical and Surgical Journal* in 1881-1911. At the time of his retirement he was senior physician to the Boston City Hospital. He was an overseer of Harvard in 1890-1901 and in 1903-12.

SHATTUCK SCHOOL, The, a noted college preparatory school at Faribault, Minn., organized in 1865 and controlled by the Protestant Episcopal Church. The corporate name of the Shattuck School and the Seabury Divinity School, which is also at Faribault, is the "Bishop Seabury Mission." The school has 19 instructors and 250 students. The school course is divided into five forms of one year each, and the establishment is managed on the house system. Military drill is obligatory, and there is a cadet corps with four companies, and an artillery platoon with two detachments. The principal buildings connected with the school are the chapel, Shumway, Morgan, Smyser, Whipple and S. S. Johnson halls. The school was named in honor of one of its earliest benefactors, Dr. George Shattuck, the founder of Saint Paul's School, Concord, N. H., and its head master from 1867 has been the Rev. James Dobbin. Since its organization the school has graduated over 2,000 students. Consult Adams, 'Some Famous American Schools' (1903).

SHAUGHNESSY, shā'ně-sī, **Thomas George**, 1ST BARON OF MONTREAL, Canadian railway president: b. Milwaukee, Wis., 6 Oct. 1853. In 1868-82 he was connected with the Milwaukee and Saint Paul and the Chicago, Milwaukee and Saint Paul railroads, in which time he gained a mastery of railroad management. He became purchasing agent of the Canadian Pacific Railway in 1882, later was assistant general manager and is now president of the Canadian Pacific Railway and all its associated companies. He accomplished an important share in the development of Canada and his services were recognized by a knight-

hood in 1901, while in 1916 he was created Baron Shaughnessy of Montreal.

SHAW, shā, Albert, American editor and political economist: b. Shandon, Butler County, Ohio, 23 July 1857. He was graduated from Iowa College, Grinnell, Iowa, in 1879, took a post-graduate course in constitutional history and economic science there, and in 1881 began a course in history and political science at Johns Hopkins, taking the degree of Ph.D. in 1884. In 1883-88 and again in 1889-90 he was on the editorial staff of the *Minneapolis Tribune*, in 1888-89 he studied in Europe and in 1891 established the *American Review of Reviews*, which he has since edited. In 1884 he published 'Icaria, a Chapter in the History of Communism,' which was translated into German. His other works include 'Co-operation in the Northwest' (1888); 'Local Government in Illinois' (1883); 'Municipal Government in Great Britain' (1895), and 'Municipal Government in Europe' (1895). The last two mentioned gave him a recognized standing as an authority on questions of municipal government, and he has since written many magazine articles on economic, especially municipal, subjects. Other works are 'The Business Career in its Public Relations' (1905); 'Political Problems of American Development' (1907); 'The Outlook of the Average Man' (1907); 'Cartoon History of Roosevelt's Career' (1910).

SHAW, Anna Howard, American woman suffrage leader, minister and physician: b. Newcastle-on-Tyne, England, 14 Feb. 1847; d. Moylan, Pa., 2 July 1919. She came to the United States at the age of four, studied at Albion College, Michigan in 1872-75, was graduated at the Boston University of Theology in 1878 and took her M.D. at Boston University in 1885. She was granted a local preacher's license by the district conference of the Methodist Episcopal Church, and paid the expenses of her education by preaching and lecturing. She was pastor of the Methodist Episcopal Church at Hingham, Mass., in 1878, and at East Dennis in 1878-85. She was, however, refused ordination by the New England Conference because of her sex, and the decision was confirmed by the General Conference at Cincinnati in 1880. She was ordained in the Protestant Methodist Church 12 Oct. 1880, the first woman ordained by that denomination. In 1885 she resigned her pulpit to lecture for the Massachusetts Woman Suffrage Association. She was national superintendent of franchise for the Women's Christian Temperance Union in 1886-92; and in her connection with the National American Woman Suffrage Association she was national lecturer in 1886-1904; vice-president-at-large in 1892-1904; president in 1904-15; and thereafter was honorary president. To her courage, initiative, resourcefulness and sound reasoning may be credited much of the success of the woman suffrage movement, the constitutional amendment for which was passed by Congress shortly before her death. She was in her lifetime the recipient of world-wide honors, had spoken in every State in the Union, before most of the State legislatures, before the committees of both houses of Congress; as well as being the first woman to speak in Gustav Vasa Cathedral, the State Church of Sweden, and the first

ordained woman to preach at the universities of Copenhagen, Berlin, Christiania, London and Amsterdam. She was chairman of the Woman's Committee of the Council of National Defense from 1917, and received the distinguished service cross for her services in the European War.

SHAW, Byam, English artist: b. Madras, India, 13 Nov. 1872. In 1878 he went with his family to England, and received his art education at the Saint John's Wood School of Art and the Royal Academy Art Schools (1890-92). In 1892 he began work as an illustrator, and gradually attained success in this line, first painting 'Rose Marie,' being exhibited in 1893. His work was received with favor by art critics and became immediately popular as well. It is marked by individuality, fertility of imagination and brilliant coloring. His other pictures include 'Silent Moon' (1894); 'Whither?' (1896); 'Love's Baubles' (1897); 'Truth' (1898); 'Love the Conqueror'; 'A Woman's Protest'; 'The Lady of Shalott.' Among the works he has illustrated are 'Brownings Poems' (1898); 'Tales from Boccaccio' (1899); 'Chiswick Shakespeare' (1900); 'Old King Cole's Book of Nursery Rhymes' (1901); 'Coronation Book' (1902); 'Pilgrim's Progress' (1904); 'The Cloister and the Hearth' (1909); Poe's 'Tales' (1909).

SHAW, George Bernard, Irish dramatist and critic: b. Dublin, 26 July 1856. He went to London in 1876, engaged in socialistic agitation, and in 1884 became one of the founders of the Fabian Society. To the volume of 'Fabian Essays in Socialism' (1889) he contributed 'The Basis of Socialism' and 'The Transition to Social Democracy.' During 1886-94 he wrote musical and art criticisms for the *World, Truth and the Star*. In 1895-96 he contributed dramatic criticism to the *Saturday Review*, and arrested attention by the vigor and severity of his judgments. In 1892 his first play, 'Widower's Houses,' was produced at the Independent Theatre, and was published as Volume I of the Independent Theatre series of plays. Between 1880 and 1883 he published several novels, such as 'The Irrational Knot'; 'Love Among the Artists'; 'Cashel Byron's Profession' and 'An Unsocial Socialist.' Two volumes of interpretative studies, 'The Perfect Wagnerite' and 'The Quintessence of Ibsen,' deal with the works of Wagner and Ibsen, the former especially concerning itself with Wagner's chief work, 'The Ring of the Nibelungs.' In 1898 he published two volumes of 'Plays Pleasant and Unpleasant,' containing the 'Widower's Houses'; 'The Philanderer' and 'Mrs. Warren's Profession'; 'You Never Can Tell'; 'Arms and the Man'; 'Candida' and 'The Man of Destiny.' In 1900 appeared 'Three Plays for Puritans'; followed by 'The Admirable Bashville' (1901); 'Man and Superman' (1903); 'John Bull's Other Island' (1904); 'How He Lied to Her Husband' (1904); 'Major Barbara' (1905); 'The Doctor's Dilemma' (1906); 'Getting Married' (1908); 'The Showing-up of Blanco Posnet' (1909); 'Press Cuttings' (1909); 'The Dark Lady of the Sonnets' (1910); 'Misalliance' (1910); 'Fanny's First Play' (1911); 'Androcles and the Lion'; 'Pygmalion'; and 'Overruled' (1912); 'Great Catherine' (1913);

'The Music-Cure' (1914); 'O'Flaherty, V. C.'; 'The Inca of Persalem' (1915); 'Augustus does His Bit' (1910); 'Heartbreak House' (1917). Other works include 'The Sanity of Art' (1895); 'The Common Sense of Municipal Trading' (1904); 'Socialism and Superior Brains' (1910); 'Common Sense about the War' (1914); besides numerous contributions to syndicate journalism. He is fearless, vigorous and witty, a master of irony, unhampered by the traditions either of the theatre or of literature, his style having that ephemeral brilliance without permanent quality which pleases the passing popular fancy. As a dramatist he is resourceful in effective situations; but his plays appeal to a limited public. (See *CANDIDA*; *MAN AND SUPERMAN*). Consult his preface, 'Mainly About Myself,' to Volume I of 'Plays Pleasant and Unpleasant' for statement of his point of view; Burton, R., 'Bernard Shaw; The Man and the Mask' (1916).

SHAW, Henry Wheeler, "JOSH BILLINGS," American humorist: b. Lanesborough, Mass., 21 April 1818; d. Monterey, Cal., 14 Oct. 1885. He entered Hamilton College in 1832, but remained only one year. He then went to the West to pursue a number of occupations offered by the primitive frontier life, but returned to the East in 1858, and became an auctioneer at Poughkeepsie. He contributed humorous articles to a local paper under the signature of "Josh Billings," but his writings failed to attract much attention until he employed a style of phonetic spelling resembling his homely method of pronunciation. His first book, 'Sayings of "Josh Billings"' 1866, had an enormous success. For many years he contributed to the *New York Weekly*. His most successful literary venture was a travesty on the 'Old Farmer's Almanac,' published for many years by the Thomas family, "Josh Billings Farmers' Allminax." Over 200,000 copies were sold within two years of its appearance in 1870. In 1863 he began to give public lectures, which consisted of detached bits of homely philosophy, usually pointing a moral. The delivery having an inimitable strain of drollery made him a great popular success. He published 'Every Boddy's Friend' (1876); 'Josh Billings' Complete Works' (1876); 'Josh Billings' Trump Kards' (1877); 'Josh Billings' Spice-Box' (1881). Consult the 'Life' by F. S. Smith (New York 1883).

SHAW, John, American naval officer: b. Mount Mellick, Queen's County, Ireland, 1773; d. Philadelphia, Pa., 17 Sept. 1823. After serving on American merchant ships he commanded the schooner *Enterprise* of the United States navy, and in December 1799 started on an eight months' cruise, during which he engaged in five actions with the French, recapturing 11 American prizes and taking five French privateers. In one hour's combat he forced the *Flambeau*, a French vessel of 100 men and 14 guns, to surrender after half of her men were killed or crippled, while the *Enterprise* had sustained a loss of but 10. Shaw was raised to the rank of captain; in 1811 he directed the defenses of New Orleans, La., and in 1813 commanded the naval force which recaptured Mobile, Ala.; in 1814 while in charge of a squadron he was blockaded by the enemy in the Thames River between New London and Norwich, Conn., sub-

sequently seeing other service both at home and abroad.

SHAW, John Balcom, American Presbyterian clergyman, educator and author; b. Bellport, N. Y., 12 May 1860. He was graduated at Lafayette College in 1885, at the Union Theological Seminary in 1888 and was ordained in that year. He held pastorates in New York, Chicago and Los Angeles in 1888-1915, and has since been president of the Elmira College for Women. Author of 'Four Great Questions' (1898); 'The Difficult Life' (1903); 'Vision and Service' (1907); 'The Angel in the Sun' (1914), etc.

SHAW, John William, American Catholic bishop: b. Mobile, Ala., 12 Dec. 1863. He was educated at the academy of the Brothers of the Sacred Heart, Mobile, at Saint Finian's Seminary, Navan, Ireland, the University of the Propaganda and the North American College, Rome. He was ordained to the Roman Catholic priesthood on 26 May 1888. In 1888-89 Father Shaw was assistant at the cathedral of Mobile; in 1889-91 assistant and missionary at Saint Peter's Church, Montgomery, Ala., and in 1891-1910 was rector of the cathedral at Mobile and chancellor of the diocese. On 7 Feb. 1910 he was appointed coadjutor bishop of San Antonio, Tex., and was consecrated on 14 April. He succeeded to the see of San Antonio, 11 March 1911.

SHAW, Lemuel, American jurist: b. Barnstable, Mass., 9 Jan. 1781; d. Boston, Mass., 30 March 1861. He was graduated at Harvard University in 1800 and became prominent in the practice of law in Boston. He sat in the Massachusetts house of representatives and senate, 1811-16 and in 1819, and in the State senate 1821-22 and 1828-29, and was a member of the State Constitutional Convention of 1820. As chief justice of the Massachusetts Supreme Court, 1830-60, he won a high reputation as a jurist. His publications include addresses and orations. He was a Fellow of the American Academy of Arts and Sciences; a member of the Massachusetts and New England Historical Societies and of various local clubs, and a trustee of the Boston Library and Humane societies. He translated from the French the 'Civil and Military Transactions of Bonaparte.' His judicial decisions comprise nearly 50 volumes.

SHAW, Leslie Mortier, American lawyer and politician: b. Morristown, Vt., 2 Nov. 1848. He was graduated from Cornell College, Mount Vernon, Iowa, in 1874, and from the Iowa College of Law in 1876; was admitted to the bar and established a law practice in Denison, Iowa. He was also prominent in local financial circles, and became president of the bank of Denison, and of the bank of Manilla, Iowa. He occasionally took part in the campaign work of the Republican party, but did not become prominent until the campaign of 1896, when his strong advocacy of the gold standard, his skilful handling of statistics and keen arguments in public speaking won him a wide reputation, and he was called upon to speak in many different sections of the country. His effective work on the Republican side in the free silver campaign of 1896, speaking an average of five hours a day some weeks and as high as seven hours for several consecutive days, led to his

nomination and election the following year as governor of Iowa. He was re-elected two years later, doubling his plurality and multiplying his majority by four. He declined a third nomination. In 1898 he was president of the International Monetary Congress at Indianapolis. At the end of his second term as governor he became Secretary of the Treasury in President Roosevelt's Cabinet and held that position a little over five years — the longest term in that office since 1841. He resigned in 1902 and was engaged in banking in New York and Philadelphia until 1913 when he retired. Since then he has lectured occasionally, and frequently engaged in joint debates on both economic and social questions. He has divided his residence between New York City and San Diego, Cal.

SHAW, Richard Norman, English architect: b. Edinburgh, 7 May 1831; d. 1912. He was educated at Edinburgh where he practised as an architect, being chiefly engaged in the erection of dwelling-houses. He published 'Sketches from the Continent' (1858); and (with T. G. Jackson) 'Architecture, a Profession or an Art' (1891). He was very successful in planning substantial houses of a plain yet elegant elevation, and to his brick structures of this sort he has imparted a certain dignity and charm which lends to them the personal stamp of good taste a host of followers have imitated, but rarely attained. In 1872 he was made associate, and in 1877 member, of the Royal Academy. He retired in 1901.

SHAW, Robert Gould, American soldier: b. Boston, Mass., 10 Oct. 1837; d. Fort Wagner, Charleston Harbor, S. C., 18 July 1863. He studied at Harvard, entered a New York counting-room, enlisted in the 7th New York regiment at the outbreak of the Civil War, and was promoted captain (1862). In 1863 he was made colonel of the 54th Massachusetts, the first negro regiment sent from the free States. The regiment left Boston for the front 28 May, acquitted itself satisfactorily in a skirmish on James' Island, near Charleston, S. C., 16 July, and on 18 July participated with distinction in the desperate attack on Fort Wagner (q.v.). Shaw was killed while leading his troops. The well-known Shaw memorial by Saint Gaudens was placed in 1897 on Boston Common. Boston has also a bust of this brave officer by Edmonia Lewis. Consult Higginson, 'Harvard Memorial Biographies' (Vol. II, Boston 1866); and Teamoh, R. T., 'Sketch of the Life and Death of R. G. Shaw' (Boston 1904).

SHAW, Sir William Napier, English physicist: b. 4 March 1854. He was educated at Emmanuel College, Cambridge, and at the University of Berlin, was elected Fellow of Emmanuel College 1877 and was senior tutor there 1890-99. From 1897 to 1905 he was a member of the Meteorological Council and in the latter year was made director of the Meteorological Office. He was knighted in 1915. He has published important papers on 'Electrolysis'; 'The Pyrometer'; 'Meteorology' and with R. T. Glazebrook, 'A Text-book of Practical Physics' (1884); 'Air Currents and the Laws of Ventilation' (1907); 'Forecasting Weather' (1911), etc.

SHAW UNIVERSITY, an institution for the education of the colored race at Raleigh,

N. C. It was founded under the auspices of the American Baptist Home Mission Society primarily for the education of colored preachers for the Baptist ministry. Henry Martin Tupper, D.D., was appointed president, and organized the first classes in 1865, in a negro cabin on the outskirts of the city; in March 1866 was formed the first class for colored women, and thenceforth the school has been for both sexes. In 1870 the present campus, including a whole city block, was purchased for \$15,000; the buildings were put up with brick made by the students. The university obtained a charter from the State legislature in 1875. The organization of the university includes the Normal, Collegiate Scientific and Industrial departments, the Theological School, the Missionary Training School, the Leonard Schools of Medicine and Pharmacy and the Law School. The collegiate department includes a preparatory course of two years; the regular college course is four years; the degrees of A.B. and B.S. are conferred. Music is a part of the curriculum. The course in the medical school occupies four years; the Leonard Medical Hospital is a part of the university. Industrial training and work has been a feature from the first; each student is required to do some kind of manual work, and training is given in carpentering, cabinet, bent iron and machine-shop work, mechanical drawing, architecture and blacksmithing, sewing, dressmaking, laundering and domestic science. There is also a summer school and a night school (established 1899). The most important buildings include Estey Hall, Show Hall, the chapel, the medical dormitory, administration building, industrial building, laundry, Leonard Medical building, Hall of Pharmacy, hospital, Missionary Training building. The valuation of all property is \$167,000. The tuition fees are small, and the institution is supported partially by the American Baptist Home Mission Society. The university occupies a leading place in the work of the education of the colored race, and has won the respect of the Southern people. It is unable to meet the demands made upon it, and is obliged to refuse admission to many students. The students in 1917 numbered 366, the faculty 27.

SHAWINIGAN FALLS, shā'in-ī-gān, or **SHAWENEGAN FALLS**, Canada, town in Saint Maurice County, province of Quebec, on the Saint Maurice River, 70 miles northeast of Montreal, and on the Canadian Pacific and the Canadian Northern and Quebec railways. The falls nearby are 165 feet high and furnish abundant water power for manufactures, which include paper, carbide and aluminum. The town has a college, convent and hospital. It was incorporated in 1909. Pop. 4,265.

SHAWL, a cloth worn loosely over the shoulders, among civilized nations, chiefly by women, but in semi-civilized and barbarous peoples by both sexes. Shawls, on account of their simplicity, are ancient garments. They are mentioned by very old writers and are thought to be alluded to in the Bible (Ezek. xxvii). The most ancient shawls, as well as the finest are made in Cashmere, where the manufacture has been carried on in the same method for centuries, even the patterns of the shawls changing but little. The material is a very fine yarn made from the under wool of the shawl-goat of Tibet.

The yarn, known as pashmina, which is in reality a fine thread, commands a high price in the market, from \$9 to \$12 a pound. The dyes used are permanent. The patterns of the shawls are produced by weaving, and by embroidery. Where the design is to be embroidered the ground of the shawl is of a plain pashmina fabric. Very primitive looms are employed. Three or four men sometimes work at one loom, and for some of the finer shawls a year's time is necessary. The more ordinary shawls are produced about five a year, to each loom. Sometimes these shawls are woven in separate portions, and afterward joined together with great skill. Cashmere shawls sell as low as \$70 or \$80, but one of a first-class pattern and coloring will cost \$1,200 to \$1,500. Such a shawl will weigh about seven pounds and the texture will be very fine and close and the design intricate. About \$150 will represent the cost of the materials used, \$750 the labor expended and \$600 the duty to be paid and other expenses. In the Punjab of India inferior shawls are manufactured at Nurpur, Amritsar and also in Kerman, Persia, the art having been carried over from Cashmere. The fine pashmina is mixed with the coarser goat's wool, called kaork. The finest shawls in Persia are also made of silk to resemble Cashmere shawls.

The production of shawls was until recent years a very important manufacture in France, and gave occupation to many in Paris, who not only furnished designs for those woven in their own country—chiefly at Paris, Lyons and Nîmes—but also for shawl-manufacturers in England and Austria, and even for some woven in Cashmere. In 1867 it was estimated that the annual value of the French shawl trade amounted to nearly a million pounds sterling. At Paisley in Scotland, where for many years previous to 1860 the manufacture of shawls was of great importance, the trade originated in the beginning of the 19th century, and at its height occupied 8,000 looms. They were made of silk, wool or cotton, either separately or in combination; but the best-known class of Paisley shawls was manufactured of fine wool imitating Cashmere designs. Soon after the middle of the century the manufacture began to decline and has now ceased. Tartan shawls, however, chiefly of small size, for indoor or occasional wear, are still made at several places in Scotland.

SHAWNEE, shā-nē', Okla., the metropolis of Pottawatomie County, situated in the "Heart of Oklahoma" on the north bank of the North Canadian River, on the Chicago, Rock Island and Pacific, the Atchison, Topeka and Santa Fé and the Missouri, Kansas and Texas railways. The city has an altitude of 1,006 feet. Shawnee is the centre of a fertile and productive agricultural section of large extent, producing a large diversification of crops. The business interests of the city are large and constantly growing. The industries include flour mills, cotton oil mill, cotton compress and gins, large garment factory, foundry and machine shops, cigar factories, mattress factories, wholesale grocery houses and produce houses. The retail trade exceeds \$3,000,000 annually and the city has a large jobbing business. The shops of the Rock Island and the Santa Fé are lo-

cated here and the Missouri, Kansas and Texas maintains a freight terminal. The factory and railroad employees number 1,500, and the annual payroll exceeds \$3,000,000. Shawnee has five banks with combined resources of \$6,204,254 and deposits of \$4,737,780.75 on their March 1919 statements. The postal receipts for the past year were \$61,384. The city has a modern school system with eight ward and one modern high school building. There are 3,732 pupils in public schools and the Baptist State University and the Catholic University are located here with good enrolments. All religious denominations are represented with substantial buildings, there is a Carnegie public library and many acres of public parks. The city is under the charter form of government, electing a mayor, six councilmen and a city treasurer. All other officers are appointed by the mayor and confirmed by the council. The city has expended more than \$800,000 for permanent municipal improvements, and is interested in the best and most modern civic developments. A complete sewer system ramifies the entire city. The government census in 1910 was 12,000 and the government estimate 1915 is 18,000 population.

SHAWNEE INDIANS (contracted from the Algonquian *Shawanogi*, "southerners"), an important tribe of the Algonquian stock of North American Indians, who, according to the best evidence, were originally an offshoot from the Lenape or Delawares, which migrated southward, hence their popular name. It is believed that they entered the present limits of the United States from the territory north of the Great Lakes via the lower peninsula of Michigan, various bands or divisions settling in southern Illinois, southern Ohio and (the larger part) on Cumberland River. A portion of the latter drifted southeastward to the headwaters of the Savannah, where they came in contact with the Cherokees and Catawbias, who forced them northward into Pennsylvania by 1707, while those remaining on Cumberland River were driven away by combined Cherokees and Chickasaws. They were first mentioned under the name Ouchaouanag, in 1648, as living to the westward of Lake Huron; later in the century they were found by La Salle in northern Illinois, while others were settled along the Ohio and the Cumberland, and indeed had extended into Maryland, Virginia and Pennsylvania, and even as far south as Mobile, Ala., in the country of the Creeks. They were at war with numerous tribes at various periods, as well as with the French, and later with the United States, from the beginning of the French and Indian War until about 1795, during which time they had concentrated north of the Ohio River. Anthony Wayne's victory, followed by the Treaty of Greenville in 1795, terminated the hostilities of the Indians of the Ohio Valley region, a considerable part of the Shawnees moving to Missouri, within Spanish territory, while a few years later others migrated to White River, Ind., on invitation of the Delawares. Early in the 19th century, Tenskwatawa, the "Shawano Prophet," brother of the celebrated Tecumseh, preached a new doctrine the acceptance of which would open the way to future happiness and a return of the old order of things, not unlike the "Ghost Dance" religion which in-

volved so many of the Western tribes beginning with 1890. The Prophet gathered many adherents from far and wide, who established themselves at the mouth of Tippecanoe River, Indiana. To overcome their hostile demonstrations, General Harrison in 1811 led an expedition against them, resulting in the defeat of the Indians in the celebrated battle of Tippecanoe and the destruction of their settlement, while the tragic death of Tecumseh, their recognized leader, in the following year, tended to break their hostile spirit. The Shawnees of Missouri sold their lands to the government in 1825 and were assigned to a reservation in Kansas, but meanwhile a large number of them had departed for Texas where they settled on the headwaters of Sabine River until driven out in 1850. In 1831 the Ohio Shawnees ceded their lands to the United States and joined their kindred in Kansas, and in 1845 a large part of these Kansas Shawnees moved to the Canadian River in Indian Territory, where they have since been officially known as Absentee Shawnees. In 1867 the mixed Shawnees and Senecas who had moved from Ohio to Kansas about 1831, also migrated to Indian Territory, where they became known as Eastern Shawnees, and in the meantime the rest of the tribe joined the Cherokees in Indian Territory, with whom they are now incorporated. The Shawnees known as Black Bob's band are those who at first refused to move from Kansas with the others. There are also Shawnees among the Tuscaroras in New York, and others are incorporated among the Teton Sioux, while in 1840 a number of the tribe accompanied a party of trappers to the Tulare Valley of California.

The Shawnees were early described as of good stature, an active, sensible, cheerful people, full of laughter and drollery, courageous, high-spirited and manly, yet "the most deceitful in human shape." Each town had its headman. Polygyny was common and infanticide frequently practised. It was said that most of the Shawnees could speak several languages, due, no doubt, to their roving propensities when occasion required, although they were agriculturists in the main. The tribe had four phratral organizations, the members of which occupied different sides in the council-house during public assemblies. So far as known 13 gentes were recognized. Of the population of the Shawnees in early times there is no reliable information, the estimates ranging from 1,000 in 1736 to 2,000 in 1817. In 1910 the population of the Shawnee aggregated 1,338, of whom 1,300 were in Oklahoma, part on the Quapaw Reservation, part on the Sauk and Fox Reservation, while the larger proportion are incorporated with the Cherokees.

SHAYA ROOT, the root, or the plant itself, of *Oldenlandia umbellata*, of the madder family, and sometimes called Indian madder. It is a slender branching annual, with narrow opposite leaves, and small flowers in panicles. It grows wild, and is also cultivated, on the Coromandel coast, the outer bark of its roots yielding the well-known durable red-dye seen in Indian cotton goods. The leaves have been used as an expectorant in native medicine.

SHAYS, shāz, Daniel, American soldier, leader of the "Shays' Rebellion" in Massachusetts: b. Hopkinton, Mass., 1747; d. Sparta, N. Y., 29 Sept. 1825. He is first heard of as an ensign at Bunker (Breed's) Hill, was made captain 1 Jan. 1777 and resigned from the service. There is testimony that he was a good soldier. The rebellion of 1786-87, in which he was the directing figure, arose from a spirit of unrest and lawlessness then generally on the increase in the country, but more particularly from special reasons for dissatisfaction in Massachusetts. Among these were the wastefulness in the costs of litigation, the high salaries attached to public offices, and above all the exorbitant land taxation. The time was one of financial depression, and Governor Bowdoin in his endeavors to sustain the credit and diminish the debt of the State undoubtedly caused heavy burdens to fall upon poorer citizens inland. Sheriffs' and County Courts were kept busy. In the fall of 1786 five or six hundred malcontents, under command of Shays, gathered at Springfield, the purpose being to overawe the Supreme Court about to sit there and prevent the finding of indictments. After a three days' session the court adjourned. In November, when the Court of General Sessions attempted to sit at Worcester, Shays filled the courtroom with an armed force and no court could be held. Washington was deeply alarmed at the reports of these early successes of the insurgents. "It was but the other day," said he, "that we were shedding our blood to obtain the constitutions under which we now live—constitutions of our own choice and making—and now we are unsheathing the sword to overturn them." An army of 4,400 was now enlisted for 30 days by Governor Bowdoin, and the money for equipment and munitions was raised by a loan from wealthy citizens. The command was given to Gen. Benjamin Lincoln, a Revolutionary veteran. On 25 Dec. 1787 Shays, with 1,100 troops, made an attack on the Springfield arsenal, guarded by General Shepard with 1,200. Shepard at first commanded his men to fire above the insurgents' heads, but as the latter continued to advance in good order, a volley was directed into their ranks. Four fell, and the insurgents retreated in much confusion, continuing their flight, with many desertions, from town to town. Lincoln pursued them to Petersham, where on 3 February 150 were taken and the rest dispersed. The rebels continued to gather in small bands, for some months, but no large force again appeared. The greatest clemency was shown toward the leaders, and a very general amnesty

proclaimed. Shays removed to Vermont, was pardoned and went thence to Sparta, N. Y., where he obtained a pension for his Revolutionary services. Consult McMaster, 'History of the People of the United States' (Vol. I, 1883); Minot, 'History of the Insurrections in Massachusetts in 1786 and the Rebellion Consequent Thereon' (Boston 1810); Holland, 'History of Western Massachusetts' (Springfield 1855); *New England Magazine* (new series, Vol. XXIII, No. 5, January 1901); 'Reminiscences of Shays' Rebellion'; Rivers, 'Captain Shays.'

SHAYS' REBELLION. See SHAYS, DANIEL.

SHE, a romance by Rider Haggard (1887), a young Englishman goes to Africa to avenge the death of an Egyptian ancestor, whose strange history has come down to him in an old manuscript. The ancestor, a priest of Isis, had been slain by an immortal white sorceress somewhere in Africa. The sorceress, "She," and the Englishman finally meet, recognize a mysterious bond between them and, at the climax of the story, visit a place where burns a mysterious fire which gives thousands of years of life, loveliness, strength and wisdom or else swift death. "She" for the second time passes into the flame and is instantly consumed.

SHE-OAK, any one of the small trees or shrubs of the peculiar genus (*Casuarina*) of oaks, native to the East Indies and Australia. Although closely related to oaks and walnuts, the she-oak has no true leaves, substituting whorls of long drooping, slender deciduous branchlets and is said to resemble both Scotch firs and giant horsetails, in its wide-spreading top. It casts but little shadow. The branchlets are acidulous in taste and are liked by cattle. A small and round fruit is called the she-oak apple and is of bitter taste and used to flavor beer. The wood of the she-oak is extremely hard, makes excellent fuel and is valuable for woodworking; in some species it is reddish, with light and dark streaks, and is called beef-wood. The Australians make boomerangs and other weapons out of its roots. *Casuarina stricta* is the species known as coast she-oak, or sometimes as he-oak; the forest or erect she-oak is *C. suberosa* and the desert one is *C. glauca*.

SHE STOOPS TO CONQUER. Though he was thoroughly a child of his time, it was Goldsmith's peculiar genius that he went to life for his influences rather than to books. The central feature of 'She Stoops to Conquer' has some resemblances with Farquhar's 'The Beaux' Stratagem,' but its veritable source was undoubtedly an episode in the youthful career of Oliver himself.

If in the theatre Goldsmith seems to have been more of a reformer than elsewhere the reason is not far to seek. The refinements of that sentimental comedy which in his day controlled the stage were repugnant to him as an instinctive artist. Before his playwriting days Goldsmith had ridiculed "genteel comedy" and in the "low" passages of 'The Good-Natured Man' had resolutely entered the lists against it. 'She Stoops to Conquer' is the author's second and more successful play. Less artificial

than the comedy of manners, to which general class it belongs, it has more of Fielding in it than of Congreve. No one but Goldsmith could have given such a view of a country house. And even the London characters are freshly viewed. Their city manners are crossed with the forthrightness of nature. Raillery and repartee dwindle in importance before character and atmosphere. The difference between Goldsmith and Sheridan was that the former knew life whereas the latter knew only the stage. Squire Hardcastle is drawn without a stroke of over-elaboration. Less sportive than Tony he digs as deeply into the memory; but Tony and his mother linger as something more than caricatures. Kate Hardcastle is as much a product of observation as Millamant of 'The Way of the World' is a product of thought and Maria of 'The School for Scandal' is a product of the stage. It is the veritableness of the atmosphere of the play that saves it from, what the plot would make it, sheer farce. Goldsmith was not fortunate in his relationships with Colman and Garrick, the two monopolists of the theatre of his day. Yet upon its performance by Colman at Covent Garden Theatre, 15 March 1773, 'She Stoops to Conquer,' "succeeded prodigiously" (Walpole). It holds the stage in frequent revivals to this day. Editions: Masson, D., *Globe* edition (1869); Dobson, A., ed., *Belles Lettres Series* (1905); Temple Dramatists (1900); Everyman's Library (Vol. 415). Consult Forster, 'Life and Adventures of Oliver Goldsmith' (1848); Dobson, A., 'Memoir' (1899); 'Cambridge History of English Literature.'

THOMAS H. DICKINSON.

SHEA, shā, John Dawson Gilmary, American historian: b. New York, 22 July 1824; d. Elizabeth, N. J., 22 Feb. 1892. His father was principal of the Columbia College Grammar School where he gained his education, and subsequently he studied law and was admitted to the bar in 1846. He soon turned to literature, was connected in an editorial capacity with Frank Leslie's publishing house and later edited the *Catholic News*. But for many years his attention was given to historical research in preparation of his 'History of the Catholic Church in the United States,' the fourth volume of which was in process of publication at the time of his death. He was connected with many historical societies in America and Europe and was the first president of the Catholic Historical Society of the United States. His published works include 'The Discovery and Exploration of the Mississippi Valley' (1853); 'History of the French and Spanish Missions among the Indian Tribes of the United States' (1854); 'The Catholic Church in Colonial Days' (1883); 'The Hierarchy of the Catholic Church in the United States' (1886); 'Early Voyages Up and Down the Mississippi' (1862); 'Novum Belgium, An Account of the New Netherlands in 1643-44' (1862); 'The Operations of the French Fleet under Count de Grasse' (1864); 'Life of Pius IX' (1875); 'Story of a Great Nation' (1891), besides many translations and other works.

SHEAFFE, shēf, Sir Roger Hale, Canadian general and administrator: b. Boston, Mass., 15 July 1763; d. Edinburgh, Scotland, 17 July 1851. He was appointed ensign in the

British army in 1778 and was promoted lieutenant in 1780. He served in Ireland in 1781–87 and in Canada in 1787–97, attaining rank of lieutenant-colonel in 1789. He was on duty in Holland in 1789 and accompanied the expedition to the Baltic in 1801. He returned to duty in Canada in 1802, reached the rank of major-general in 1811 and was on leave for a year. He was again on active duty in 1812–13, and on 13 Oct. 1812 he recaptured Queenstown from the United States troops. He retained command of the British forces and administered the government of Upper Canada until 1813. He was knighted in 1813, and in 1838 he was nominated general.

SHEAR, Cornelius Lott, American plant pathologist: b. Coeymans Hollow, N. Y., 26 March 1865. He was graduated at the New York State Normal School at Albany in 1888, at the University of Nebraska in 1897, and took his Ph.D. at George Washington University in 1906, studying also at the universities of Munich, Berlin, Leyden and London. From 1895 he was connected with the United States Department of Agriculture where since 1902 he has been plant pathologist. He was editor of the *Asa Gray Bulletin* in 1898–1900; associate editor of the *Plant World* in 1900–05, and since 1911 has edited *Phytopathology*.

SHEARD, shērd, Charles, Canadian physician: b. Toronto, Ontario, 15 Feb. 1857. He was educated at the Upper Canada College and at Toronto University, and subsequently practised at Toronto. He was medical health officer of Toronto in 1893–1910; chairman of the provincial board of health in 1909, and in 1902 he was president of the Canadian Medical Association.

SHEARD, shērd, T. F. M., English painter: b. Oxford, 16 Dec. 1866. After his graduation in 1889 he went to Paris and studied painting under Courtois, Rixens, Lefèvre and Rigolot. He has since then exhibited at the Salon, Royal Academy and the Royal Institute of Water Color Painters. He was awarded a bronze medal at the Paris Exhibition of 1900. Since 1915 he has been professor of art at Queen's College, London. He is fond of Eastern subjects, and scenery flooded with sunlight, and among his paintings of this character are 'A Market Morning in a City of the Sahara'; 'An Arab Blacksmith'; 'An Arab Fête'; 'Desert Tribesmen Returning from a Raid,' etc. Among his scenes of English peasant life may be mentioned 'Birds of a Feather'; 'The Outcast'; 'Parted'; 'The Price of Victory'; 'Hull Docks'; 'End of the Day'; etc.

SHEARMAN, shēr'man, Thomas Gaskell, American lawyer: b. Birmingham, England, 25 Nov. 1834; d. Brooklyn, 29 Sept. 1900. At nine he came to America with his parents and in 1857 took up his residence in Brooklyn. He was admitted to the bar in 1859, and in 1868 formed a partnership with David Dudley Field. Later John W. Stirling entered the firm which was continued after 1873 by Shearman and Stirling. This firm defended Jay Gould in suits resulting from the gold panic of 1869, and Henry Ward Beecher in the suit brought against him by Theodore Tilton. Shearman was an advocate of absolute free trade and a vigorous propagandist of Henry George's single tax theories. From

early years he contributed to legal literature and was joint author of 'Tillinghast and Shearman's Practice, Pleadings and Forms' (1861–65) and 'Shearman and Redfield on Negligence' (1869). He prepared for the commissioners of the New York code the 'Book of Forms' (1861) and the major part of the Civil Code relating to obligations (1865). He also published 'Talks on Free Trade' (1881); 'Pauper Labor of Europe' (1885); 'Distribution of Wealth' (1887); 'Owners of the United States' (1889); 'The Coming Billionaire' (1890); 'Crooked Taxation' (1891); 'Taxation of Personal Property' (1895); 'Natural Taxation' (1895; 3d ed., 1898).

SHEARS. See CUTLERY; HARDWARE INDUSTRY IN AMERICA.

SHEARWATER, a sea-bird which skims close to the surface of the water in search of fishes and floating animal matter upon which it feeds. The shearwaters are larger than the petrels and differ from both them and the fulmars in their long, slender bills, both mandibles of which are hooked at the end, and by the short broad nostril-tubes. The wings are long and narrow and the tail rounded or wedge-shaped, never forked. In habits they generally resemble the petrels (q.v.). Ten species are recorded as occurring on the North American coast, the best known being the common shearwater (*Puffin major*) and the sooty shearwater (*P. stricklandi*). Sailors call these birds "mutton-birds," because of the excessive fatness of the young which are good eating and the search for which has nearly exterminated the once common British species (*P. brevicaudus*). Consult Newton, 'Dictionary of Birds' (New York 1896).

SHEATH-BILL, a family of limicoline birds (*Chionididae*) belonging to the order related to the plovers. The wings are long and pointed, the tail being of moderate size. The bill is short and stout, compressed, strongly arched at its tip and provided at the base with a horny sheath which protects the nostrils. The tarsi are short and stout. The white sheath-bill or kelp-pigeon (*Chionis alba*) is the best-known species. It inhabits the shores of the islands off the southern end of South America. Its color is pure white, the legs reddish-black and its average length 15 inches. These birds feed on mollusks, carrion, fishes, crustacea, seaweeds and other food which they can pick up on the seashores. On land they much resemble pigeons, but when flying in flocks at sea are gull-like in aspect. Cook in his 'Third Voyage' says its flesh is equal to duck, but other accounts represent the flesh as very unpalatable, probably on account of the bird's food. Another species was made known in 1842 by Dr. Hartlaub, one smaller than the *Chionis alba*, with similar plumage, but having the bill and bare skin of the face black and the legs much darker. The sealers of Kerguelen Land call it the sore-eyed pigeon, from its prominent fleshy orbit.

SHEBA, shē'ba, or SABA', Arabia, the ancient capital of Arabia Felix. Its site has not been determined, but it was a great commercial centre of the Semitic tribes. The Sabæans carried on an extensive trade with India, Europe, Egypt and Syria, in frankincense, gold, ivory, ebony, fine textiles and sweet spices, and for

this purpose had depots in northern Arabia and Ethiopia. Their wealth became famous in the Orient and their queen paid a visit to Solomon with rich gifts, as cited in the Scriptures. They worshipped natural objects, especially the sun and moon. In the 8th century they were subject to the Assyrians; in 24 B.C. the Romans sent an unsuccessful expedition into their territory and in the 2d, 4th and 6th centuries they became subject to the Ethiopians. Consult Glaser, 'Geschichte und Geographie Arabiens' (Berlin 1890) and Gunkel, 'Genesis' (3d ed., Göttingen 1910).

SHEBOYGAN, shē-boi'gān, Wis., city, county-seat of Sheboygan County, situated on Lake Michigan at the mouth of the Sheboygan River and on the Chicago and Northwestern Railroad, 52 miles north of Milwaukee. It has a good harbor and steamer connection with all the principal lake ports; a regular line of freight and passenger steamers ply between the city and the other ports on the west shore of Lake Michigan all the year. An interurban electric line connects the city with Milwaukee and the City Electric operates an interurban line to Plymouth and Elkhart. The first settlement was made in 1836. The place was incorporated as a village in 1846 and in 1853 was chartered as a city. Sheboygan is the industrial and commercial centre for a large and fertile agricultural region. The chief industrial establishments are seven chair factories, 12 furniture factories, one piano factory, two toy factories, two tanneries, three shoe factories, three enameled-ware works, three carriage factories, one auto-truck factory, foundries and machine shops, lime-kilns and brick manufacturing, boiler shops, storage warehouse for cheese, etc. The number of industrial establishments is 132; number of persons engaged in manufactures, 8,056; primary horse power, 13,785; capital invested, \$21,481,000; services, \$4,358,000; salaries \$988,000; value of products, \$17,509,000. There are four State banks with a total capitalization of about \$950,000 and over \$7,000,000 in deposits. The principal public buildings are a government building, county courthouse, city hall and other municipal buildings, churches and schools. There are six public parks; in one of them is an artesian well, the waters of which contain considerable mineral salts. There are 29 churches and an asylum for the chronic insane, a city almshouse, a home for the friendless, a sanitarium and a hospital. The educational institutions are a day school for the deaf, a high school, an industrial school, public and parish elementary schools and a public school library containing about 5,000 volumes and a public library which in 1915 contained 15,079 bound volumes. Pop. 28,000.

SHECHINAH. See **SHEKINAH**.

SHEED, shēd, William Greenough Thayer, American theologian: b. Acton, Mass., 21 June 1820; d. New York, 17 Nov. 1894. He was graduated from the University of Vermont in 1839, from Andover Theological Seminary in 1843 and in 1844-45 was pastor of the Congregational church in Brandon, Vt. He was professor of English literature in the University of Vermont in 1845-52, of sacred rhetoric and pastoral theology at Auburn Theological Seminary in 1852-53 and of ecclesiastical history and lec-

turer on pastoral theology at Andover in 1853-62. He acted as assistant pastor at the Brick (Presbyterian) Church, New York, in 1862-63. was appointed to the chair of Biblical literature at Union Theological Seminary, New York, in 1863, and in 1874 was transferred to that of systematic theology, which he occupied until 1890. His publications include 'The Method and Influence of Theological Studies' (1845); 'The True Nature of the Beautiful and its Influence upon Culture' (1851); 'The Nature and Importance of Natural Rhetoric' (1851); 'Lectures on the Philosophy of History' (1856); 'A History of Christian Doctrine' (1863); 'Homiletics and Pastoral Theology' (1867); 'Sermons to the Natural Man' (1871); 'Theological Essays' (1877); 'Literary Essays' (1878); 'Commentary on St. Paul's Epistle to the Romans' (1879); 'Sermons to the Spiritual Man' (1884); 'Doctrine of Endless Punishment' (1885); 'Dogmatic Theology' (1889-94); 'The Proposed Revision of the Westminster Standards' (1890), etc. He also published 'Eloquence a Virtue, or Outlines of a Systematic Rhetoric' (1850), a translation from the German of Dr. Francis Theremin; 'A Manual of Church History' in two volumes, translated from the German of Heinrich Ernst Ferdinand Guericke (1857); edited seven volumes of Coleridge's works, with 'Introductory Essays' (1853); 'The Confession of Saint Augustine,' with introductory essay (1860); and wrote introductions to Asbury's translation of Ackerman's 'The Christian Element in Plato and the Platonic Philosophy' (1860) and to McCosh's 'Intuition of the Mind' (1864).

SHEE, shē, Sir Martin Archer, English painter: b. Dublin, 23 Dec. 1770; d. Brighton, England, 13 Aug. 1850. He was introduced in 1788 to Sir Joshua Reynolds by Edmund Burke, and in the same year became a pupil in the Royal Academy, to the exhibition of which he contributed his first picture in 1789. Although by no means the best portrait painter of his time, he was, with one or two exceptions, the most fashionable. In 1800 he was chosen a member of the Royal Academy, and in 1830, on the death of Sir Thomas Lawrence, he was elected president and knighted. He also aspired to literary distinction and in 1805 and 1809 published two parts of a poem entitled 'Rhymes on Art,' in 1814 'The Commemoration of Sir Joshua Reynolds, and other Poems,' which called forth the praise of Byron, in his 'English Bards and Scotch Reviewers':

"And here let Shee and genius find a place,
Whose pen and pencil yield an equal grace;
While honors, doubly merited, attend
The poet's rival, but the painter's friend."

Among his portraits are those of William IV and Queen Victoria; all his work is pleasing, but there is an unpleasant tendency to unnatural redness in his flesh tints. The National Portrait Gallery contains numerous examples of his works.

SHEEDY, Rev. Morgan M., author, lecturer, priest: b. Liscarroll, County Cork, Ireland, 8 Oct. 1853. He was the son of Michael and Mary (Madden) Sheedy; on maternal side, member of a family which has given many priests and distinguished writers to the world. He was educated at Saint Colman's College, Fermoy, and at the College of Maynooth; received degree of LL.D from Notre Dame Uni-

versity, Indiana, and Mount Saint Mary's, Maryland. Ordained in the Pittsburgh Cathedral by the late Bishop Tuigg, 23 Sept. 1876; assigned as professor of theology and history at Saint Michael's Seminary, where he continued until the institution was closed. First president of the Catholic Summer School of America and director of the Reading Circle Union; vice-president of the Catholic Total Abstinence Union for four years. Founder of the Pittsburgh Polytechnic Society. He lectured for the Academy of Science at the Champlain Summer School and the first session of the Catholic Winter School in New Orleans. At present permanent rector of Saint John's Church, Altoona, Pa. Editor of *The Quarterly* and a frequent contributor to the Catholic press and magazines, the *Catholic World*, *The American Ecclesiastical Review*, etc. Author of 'Briefs for Our Times'; 'Social Problems' (dealing with the labor question); 'Christian Unity,' etc.

SHEEHAN, shē'án, Patrick Augustine, Irish Roman Catholic canon and novelist: b. Mallow, County Cork, 17 March 1852; d. 6 Oct. 1913. He was educated at Maynooth College and was ordained in 1875. He held various curacies until 1895 when he became parish priest of Doneraile, and in 1903 he became also canon of Cloyne. He was known as a writer of essays, poems and novels, all of which are characterized by an intimate knowledge of Irish life and permeated with a strong Roman Catholic bias. Author of 'Under the Cedars and Stars' (1903); 'The Triumph of Failure' (1899); 'My New Curate' (1900); 'Early Essays and Lectures' (1906); 'The Blindness of the Rev. Dr. Gray' (1909); 'The Queen's Fillet' (1911); 'Graves at Kilamorna' (1915), etc.

SHEEP. The sheep (genus *Ovis*) belongs to the family of ruminants termed Bovidae, of which the ox (*Bos*) is a typical representative. Other animals such as the goat, musk-oxen, chamois and antelope belong to the same family but the sheep represents a distinct genus for which the name *Ovis* has been adopted, and, as a species, the domesticated sheep has been given the name *Ovis aries*.

Sex and Age Names.—The male sheep is known as a *ram* or *buck*. The term *buck*, however, is not regarded as good usage, but it is almost universally applied to male sheep in the western part of the United States. The female sheep is known as a *ewe* and the unsexed male as a *wether*. From birth until the age of 12 months is attained the young of sheep are called lambs; from 12 to 24 months of age they are called yearlings; from 24 to 36 months, two-year olds, et cetera.

How to Determine the Age of Sheep.—Until sheep become four years old their age can be approximated by their teeth. The temporary or lamb teeth, 20 in number, are small; the permanent teeth, of which there are 32, are broader and longer. As a rule the two temporary teeth in the middle of the front part of the lower jaw are replaced by permanent teeth when the animal is about 12 months old and two more appear each year until at four years of age all of the front teeth are permanent, making what is called a full mouth. Therefore, a sheep showing two broad teeth in front is called a yearling; one showing four broad teeth, a two-year old; one showing six such teeth, a three-

year old. Beyond the fourth year it is not possible to approximate age except in a very general way, but the teeth of a very old sheep are likely to be spread apart, missing or they may be worn down short. Other indications of advanced age are a sunken appearance over the eyes, comparatively short wool that is more or less uneven in length and a tendency toward emaciation.

Habits.—Sheep are ruminants and while they are fond of concentrated feeds they must have bulky feeds such as grass and hay. They eat all of the grasses except the very coarsest varieties and they are very fond of the cultivated leguminous plants. They eat most of the weeds common to the farms and ranges of the United States and they will feed on young tree-growth more than any other domestic animal in America except goats.

Sheep like an extensive range and comparatively short herbage. Because of their mobile lips and sharp incisor teeth they are structurally adapted to feeding on short grass. They enjoy changing from old to new pastures and they delight in feeding on the high places more than they do on the low places in their pastures. Sheep are able to exist without water longer than most domestic animals, but nevertheless they should have free access to it. Even in cold weather they will drink from two to four quarts daily. They prefer running water to still water.

In seeking a bedding-place sheep prefer relatively high ground where there is good air and water drainage. It is only in the severest periods of storm that they abandon such a place for a lower, wind-protected location. Young sheep seek high places more readily than do older ones; yearlings will feed high up on a hillside more readily than old ewes.

Breeding Habits.—Most domesticated breeds produce offspring but once a year. In the United States the mating is in the autumn, because it is at this time that the nights turn cool and this seems to have a marked influence in causing the ewes to come in heat (œstrus). The normal gestation period for ewes is about 146 days. Ewes commonly give birth to one or to two lambs. Occasionally triplets are born and in rare instances four or more. But since the female sheep has only two teats, breeders do not desire more than two lambs to each ewe.

Gregariousness.—All sheep possess the flocking instinct, but it is more pronounced in some breeds than in others. This instinct is of great importance in regions where sheep are herded on rough unfenced range, and a breed of sheep must be kept that possesses it in the most marked degree. When a sheep is separated from the flock it is an indication that it is either lost, ill or injured.

Closely associated with the gregarious instinct is the instinct to follow a leader. "Where one sheep goes all others will follow" is literally true even though it involves a long leap or a plunge into the water.

No other domestic animal is so timid and so unable to defend itself as the sheep. On this account it is a subject of prey for such animals as the wolf, coyote, dog, bobcat and mountain lion. In all countries where sheep are kept there are predatory animals of the canine and feline groups that harass sheepmen by the attacks they make upon their flocks.

Types.—Sheep were probably first domesti-

cated on the high, treeless plateaus and mountains of Turkestan, Asia, but they have been adapted to all sorts of climatic conditions and to all types of soil. Under the influence of not only soil and climatic conditions but of economic and social conditions as well, different types of sheep have been developed. At the present time most of the improved sheep may be roughly grouped under two types; one known as the fine wool type, the other as the mutton type. As these type names infer, there are sheep that have been developed primarily for their wool and others primarily for their mutton. In certain restricted areas of the world, notably in Europe and Asia, emphasis has been placed on the dairy qualities of sheep and in Asia there are types whose value depends chiefly upon the fur-like nature of their hairy covering, the lambskins of which yield what are known as the Persian, Astrakan, Broadtail and Krimmer furs.

The wool type of sheep was developed in Spain and it is known the world over as the Merino. For a long time Spain denied these sheep to the remainder of the world, but at the close of the Napoleonic wars she was no longer able to retain her monopoly on them and they were rapidly distributed in other countries. Before this time, however, the king of Spain gave permission for some of these sheep to be sent to a few other European countries and Saxony in Germany had demonstrated that they could be successively raised outside of their native home. Consequently there was great demand for them when they became available to all countries. Germany, the United States and Australia specialized in them and made them better than they had been at home.

In the United States, the Merino was first called the Spanish Merino. But various strains that had been kept separate and distinct in the native home were mingled in America. This together with different ideals in breeding soon resulted in a modified type which was first called the Vermont Merino and later the American Merino.

American Merino breeders aimed at great weight and fineness of fleece. In order to get weight, large wrinkles and folds were developed in the skin. A maximum density of wool fibres on the surface of the skin was sought after; an attempt was made to grow wool on all parts of the body and on the face and legs as well and the greatest amount possible of yolk (a combination of the perspiratory and fatty secretions from the skin) was secured. Very little attention was given to mutton properties.

This kind of sheep satisfied earlier conditions in the United States because wool was almost the sole product from flocks in regions west of the Alleghany Mountains. There was no object in producing mutton, for transportation facilities were undeveloped. If they had been developed the population of the country was too small to justify a large production of mutton and facilities for exportation were inadequate. This situation, together with the fact that no other sheep has the gregarious instinct so intensely developed and hence is not as suitable as the Merino on expansive, unfenced ranges, explains why the Merino has always been the popular sheep in new countries and why they were adopted not only by the

United States, but also by New Zealand, Australia, the Argentine and South Africa.

But as demand for mutton increased in the United States because of the increase in population and as transportation developed so that this demand could be met, changes became necessary in Merino breeding. There was also a change in the style of cloth which demanded the production of longer wool—a wool at least two and one-half inches in length so that it could be spun into worsteds. As a result strains were developed that grew longer wool and produced more meat.

At present there are three types of American Merinos known as the A, B and C types. The A type is extreme in skin folds and wrinkles, density of fleece and yolk in the wool. It is what might be called an ultra wool type. The C type or Delaine is almost free from folds and wrinkles, and its wool is not so dense, has less yolk and is longer than that of the A type. It is wider, thicker and heavier and altogether much more suitable for mutton than the A type. In practically all respects, the B type is intermediate between the A and C types. Most Merino rams have horns, but the ewes are hornless. Rams weigh from 130 pounds to 200 pounds and their weight of fleece in the grease (i.e., weight just as it comes from the sheep) ranges from 25 pounds or more in the A type to 15 pounds or more in the C type. Ewes weigh from 90 to 150 pounds and they shear from 15 pounds up in the A type to 10 pounds up in the C type.

Australian Merinos differ from American Merinos mainly in the nature of their wool. The Australian breeders have bred for long, fine wool and not for excessive yolk as have the American breeders, who have specialized in the A and B types.

In 1786 the French government began growing Merinos, having for its object a combination of mutton and wool. A number of years later some of these sheep were taken to Germany. In both countries a large, thick sheep was developed. Importations were brought to the United States as early as 1840 but they did not attain popularity until toward the close of the century. They are now known as the Rambouillet, and in the United States they outnumber all other Merinos combined. Rams weigh from 225 to 250 pounds; ewes from 140 to 170 pounds. Rams yield from 15 to 25 pounds of grease wool; ewes from 10 to 18 pounds.

The Mutton Type.—England is the native home of the mutton type of sheep. This type was intensely developed by Robert Bakewell who began his work about 1760. Prior to his time there were two general types of sheep in England. One of these was a large, coarse sheep that grew long, coarse wool and yielded a fleece weighing from 7 to 12 pounds. These sheep were kept principally on the low fertile lands of Lincoln, Leicester and on the hills of Gloucester. It was with these sheep that Bakewell accomplished his work and he founded the breed known as the English Leicester.

The other type common to England was much smaller, better able to travel, and was suited to the hills and lighter soils. It produced short, rather fine wool and yielded fleeces weighing from two to five pounds.

Following Bakewell, there was a great era of mutton improvement brought about by careful selection in some cases, by crossing and selection in others. From the lowland sheep the Longwool mutton breeds have been developed, namely, the Leicester, Cotswold, Lincoln, Romney Marsh and others.

All of the long wool breeds strongly resemble each other; they are large, up-standing sheep with white faces and legs. Their wool is coarse and long, ranging from 8 inches in Leicesters to more than 12 in Lincolns.

From the smaller, lighter shearing type, the medium wool mutton breeds have come. In this group the most prominent in America are the Down breeds such as the Southdown, Shropshire, Hampshire, Suffolk and Oxford Down. The Oxford Down, however, is a cross between the Hampshire, a medium woolled breed, and the Cotswold, a long woolled sheep. The Down breeds have dark faces and legs—the darkest being the very deep brown of the Hampshire and Suffolk, and the lightest, the light grayish brown of the Southdown. The Southdown is regarded as the best improved breed in mutton qualities, but in this respect it is closely approached by the other Down breeds. Of the Down breeds, the Southdown has the shortest, lightest fleece, while the Oxford Down has the longest fleece.

There are numerous other medium wool breeds, the most prominent in the United States being the Dorset Horn and Cheviot, which differ from the Down breeds in that they have white faces and legs. Both the males and females have horns in the Dorset Horn breed.

When refrigeration and transportation developed to the point where it was possible to ship sheep or their carcasses from outlying points to the centres of dense population there arose a demand for the mutton breeds in all countries where improved flock husbandry is practised. In some regions the mutton breeds have replaced the Merinos, but in many others where some Merino blood is indispensable, they have been crossed with the Merino to effect mutton improvement. Breeders in New Zealand by crossing the Longwool breeds on the Merino secure a blend that represented what was needed. Then they bred the cross-bred animals together and thereby in time fixed a new type which is known as the Corriedale. Some of these sheep have been imported to the United States, and crosses between the Longwools and Rambouillets are being made in this

country with a view to producing a desirable type of sheep for the intermountain region.

Types of Sheep Raising.—There are two general types of sheep raising. One involves keeping relatively large numbers on an extensive range; the other in keeping comparatively small flocks on farms where diversified agriculture is practised.

The first, generally known as the range method, is followed in the intermountain regions of the United States and Canada, in South America, South Africa, Australia, New Zealand and parts of Asia. Under this method in the United States the sheep are kept in the care of a herder on unenclosed land in bands containing from 1,500 to 3,000 head. The herder requires the whole or part time assistance of a camp tender, whose duty it is to get provisions, and move camp after selecting a new site where there is sufficient pasture; he also assists in cooking, and in counting the sheep. In winter the sheep are kept on the semi-arid plains; in spring and fall in the foot-hills, and in the summer in the national forests on the mountains. It is now customary to supplement the feed on the plains with grain and hay during severe periods in winter. All of the hay and some of the grain are grown on dry farms and irrigated land in the West. The remainder of the grain is shipped in from the Middle West and South. Australia and New Zealand have modified the range method by fencing in vast areas of land. As a result the sheep do not require a herder; they can feed according to their own inclination and hence thrive better than do sheep under a herder's care.

The keeping of small flocks on farms, known as the farm flock method, is practised in the central and eastern parts of the United States, eastern Canada, Great Britain and various other European countries. Flocks vary in size from a few head up to several hundred. As a rule farm flocks share their pastures with other classes of livestock, but in England they are often fed on quick-growing forages between hurdles. This constitutes an intensive method of handling and results in rapid growth, high finish and altogether a very superior mutton product.

Farm flocks are usually kept in regions where the climate is variable and hence special provision has to be made for feeding in winter and for sheltering in rainy and cold weather. Stored grain and roughages must be provided for. Of the grains, oats, corn, kaffir, barley and speltz are all suitable, but everything considered, oats are regarded the best for all but fattening sheep. The legume hays such as clover, alfalfa and soy beans are the best roughages, but good use can be made of corn silage and corn stover. In fact corn silage supplements splendidly with the legume hays. Some use can be made of oat and wheat straw as roughages, but they should be used in connection with the legume hays.

In northern United States, Canada and Great Britain, roots, such as Swedish turnips and Mangel wurtzels, are extensively used as feed for sheep. Being succulent they are valuable as a supplement to grain and hay.

Sheep require shelter chiefly as a protection from precipitous weather. Exposure to cold rains is especially damaging to them, particu-

larly if their wool becomes wet to the skin. Shelter is also needed if the weather is cold when the lambs are born.

Lambs are decidedly more popular than sheep as a meat product in the United States. The lambs are sold when they are from 4 to 10 months old and at live weights ranging from 65 to 90 pounds. Lambs are popular because they are toothsome and yield the size of chops and roasts most desired by American consumers.

From the standpoint of numbers and improved methods of breeding and feeding, the leading sheep countries of the world are Australia, New Zealand, United States, Argentine, South Africa and Great Britain. There are a great many sheep in Europe and Asia, but outside of a few European countries they are not well improved.

W. C. COFFEY,

Professor of Sheep Husbandry, University of Illinois.

SHEEP, Mountain, a general term for the wild sheep of the world, which collectively form a group of romantic interest, and scientific importance. Excepting their perpetual rivals, the wild goats and ibexes, they are, of all land animals, the boldest and most active rock climbers, and the most partial to mountain scenery. Wherever found, they inhabit the highest and most rugged and picturesque situations. Strange as it may appear, the haunts of the Rocky Mountain big-horn include not only our loftiest mountain ranges and many wild tracts of "bad

lands," but also the rocky walls of the great abyss known as the Grand Cañon of the Colorado. It is not strange, therefore, that all big-game hunters who love grand scenery find great fascination in the chase of wild sheep. No man worthy of the name of sportsman ever kills a ewe, but the head of an old ram, adorned with massive circling horns, won by dangerous mountain climbing and fair stalking, is a trophy of which any man may justly be proud.

It seems highly probable that the first wild sheep were developed in south-central Asia, in the region of the Altai Mountains, western Mongolia. At all events, the favorable conditions there obtaining have developed the great Siberian argali (*Ovis ammon*), whose enormous horns are a perpetual wonder to all who behold them. Near by in the Siar Mountains is found the Siar mountain-sheep. A comparatively short distance southward in Tibet is the Marco Polo sheep (*Ovis poli*), characterized by the enormous spread of its horns. A pair of horns of *Ovis poli* owned by Lord Roberts has a spread between tips of 54½ inches, and the longest horn measures 75 inches in length on the front curve. Southward of the range of the *Ovis poli*, in northern India, occurs the Punjab wild sheep, and the beautiful burghel or blue sheep, both of them small species. Southwestward of Asia only two wild sheep are found, the small but handsomely colored mouflon of Corsica and Sardinia, and the large Barbary wild sheep or aoudad of the mountains of the Barbary states of North Africa. Northward from the home of *Ovis ammon* we find the Kamchatkan sheep, a species with horns like our white sheep, but otherwise exhibiting a strong resemblance to our big-horn. And this brings us to Bering Strait.

North America contains a really fine series of mountain-sheep species almost covering the mountainous regions of Alaska, and extending down the Rocky Mountain system to the region of Lake Santa Maria (lat. 30°) in northern Mexico. In addition to this, a species known as Nelson's mountain sheep branches off in southwestern Nevada, extends through southern California and on down the peninsula of Lower California for two-thirds of its length. The total area of North America inhabited by mountain sheep is about 3,500 miles long from north to south, and its greatest width from east to west, which is found in Alaska, is more than 1,000 miles. Of North American mountain-sheep, there are three conspicuous and well-marked types, and three offshoots. When diagrammed in a manner calculated to appeal to the eyes they stand as follows:

TYPES		OFFSHOOTS	
Big-Horn (<i>Ovis canadensis</i>)	{	Nelson's Sheep (<i>Ovis nelsoni</i>)	{
Black Sheep		Mexican Sheep (<i>Ovis mexicanus</i>)	
White Sheep (<i>Ovis dalli</i>)	{	Pannin's Sheep (<i>Ovis fannini</i>)	{

The Rocky Mountain big-horn (q.v.) has been known since 1803, and is our most widely known species. All the others are of recent appearance, only the white sheep dating back as far as 1884. The range of the big-horn extends from lat. 55° and long. 120° to San Francisco Mountain, Arizona. It embraces the whole main range of the Rockies between those points,

and also includes the Fraser River country, one locality in northern Washington, two in eastern Oregon, the counties of Custer and Dawson in Montana, the Black Hills and Bighorn Mountains of Wyoming, four localities in Utah, and the Grand Cañon of the Colorado.

This is the largest and heaviest species of our *Ovis*, and carries the most massive horns. It reaches its maximum development in the main range of the Rocky Mountains in western Alberta. A large ram stands 40 inches in height at the shoulders and weighs about 325 pounds. Horns that measure 16 inches in basal circumference may justly be called very large. The largest and longest on record measured 18½ inches in basal circumference, and 52½ inches in length on outer curve, but the genuineness of this pair of horns is now doubted. One of the largest pairs in existence measures 16½ inches in basal circumference, 40½ inches in length and weighs 38 pounds. Apparently the horns of a mountain-sheep grow as long as the wearer survives in a healthy condition.

Wild sheep are not covered with wool like domestic sheep. Next to the skin is a coat of fine woolly hair, which is for warmth; but through this grows a coat of long, coarse hairs, large in diameter, pithy within and easily broken. This does duty as a rain-coat, and it also gives the animal its distinctive color. In summer, or late spring, when the old pelage is shed, the new coat is only half an inch in length, and the wild sheep stands forth fully sheared by the hand of nature. At that season the skin is worthless as a trophy. Mountain-sheep are at their best in October, November and December, and should be hunted at no other time. The lambs are born in May, and usually there is but one at a birth. Owing to the practical impossibility of keeping mountain-sheep of any American species alive in captivity, anywhere east of the Great Plains until they reach full maturity, our members of the genus *Ovis* are but little known to the general public, and consequently are quite unappreciated at their true value.

The white mountain-sheep of Alaska was not introduced to the world until 1884. It inhabits nearly all the mountainous regions of Alaska except the Alaska Peninsula, the valley of the Kuskokwim and the lower valley of the Yukon. Until recently it has been quite abundant on the Kenai Peninsula and around the head of Cook Inlet. This animal is all over pure white, and its winter pelage is long and abundant. It is smaller than the big-horn, and its horns never exceed 15½ inches in circumference. Northward its range extends almost to the Arctic Ocean, and its southern limit is found at lat. 58°. In 1901, the New York Zoological Society sent a collector to Cook Inlet to capture newly-born lambs of this species, and bring them to New York, for acclimatization in the Zoological Park. Three lambs were captured, but they proved to be such delicate feeders that all died within a few days of their capture.

The black mountain-sheep was discovered in 1896 in northern British Columbia, and good representatives of this species are to be seen in the museums of New York, Chicago and Washington. The size of the black sheep is the same as that of *Ovis dalli*. The species is characterized by the wide spread of its horns, and the

very dark color of its pelage, all except the white of the rump-patch and the abdomen. So far as known the range of this species is very circumscribed, for it has not been reported outside of a small area in northern British Columbia.

Fannin's mountain-sheep, often called the "saddle-backed sheep," was discovered on the Klondike River near Dawson City in 1900. It is an offshoot of the white sheep, and may possibly be the result of cross-breeding between that species and the black sheep. Its back, sides and tail are bluish gray, and a brown band extends down the front of each leg; but all other parts of the animal are pure white. Its horns are like those of the white sheep. But little is known of the range of this species.

The Mexican sheep and Nelson's sheep are both offshoots of the big-horn. They are short-haired and large-horned, and their prevailing color is pale salmon gray.

Wherever they are not fully protected by law, all species of American mountain-sheep are sought for and killed, by hunters for sport, and by natives for food. The total number remaining is small, and it is impossible for the survivors to be protected too rigidly. The big-horn quickly learns the value of protection, and the herd in the Yellowstone Park has rapidly increased and become so tame that it permits visitors to approach within 30 paces. SHEEP-BOT, a bot-fly (q.v.) whose maggots produce the disease of sheep called "grub in the head." See **SHEEP**.

SHEEP-DOG. See **COLLIE**; **DOG**.

SHEEP-EATERS. See **SHOSHONEAN INDIANS**.

SHEEP-LAUREL, or **LAMB-KILL**, the *Kalmia* or mountain-laurel (q.v.), which is poisonous to lambs and other small animals.

SHEEP TICK, or **LOUSE**. See **SHEEP**.

SHEEPSHEAD, the name of an important food fish (*Archosargus probatocephalus*) of the family *Sparidae*. It is a stout, deep-bodied fish, with seven or eight vertical dark bands, and may attain a length of 2½ feet and a weight of 15 pounds. It receives its name from the resemblance of its teeth to those of a sheep, having incisor-like ones in the front of the mouth and molars behind. It is found along the coast from Cape Cod to Texas and is abundant locally and especially southward wherever the conditions are favorable. Like the drumfish, the sheepshead feeds chiefly upon hard-shelled mollusks and crustaceans, and large numbers congregate where such food is

plentiful and often prove destructive to oyster-beds. For boiling and similar methods of cooking it is considered superior to any fish in our waters, and consequently has a considerable commercial importance. The sheephead is also a great favorite with anglers, many of whom are attracted to Florida fishing grounds in its pursuit. They are captured on extra stout lines and hooks baited with clam or soft-shelled crab and usually make a gallant fight before being finally landed in the boat. The freshwater drumfish (q.v.) is also called sheephead.

SHEEPSHEAD BAY. See HORSE-RACING.

SHEEPSWOOL. See SPONGE.

SHEERNESS, shēr-nēs, England, a seaport and garrison town in the county of Kent, on the Medway River where it joins the Thames, 35 miles southeast of London. It is strongly fortified and has an excellent harbor. There are spacious dock-yards, used for making repairs, and which employ very many hands. The barracks accommodate several thousand soldiers and sailors. Sheerness-on-Sea is the modern town bordering the shore; the other divisions are Marinetown (a summer bathing resort), Miletown and Bankstown. Sheerness has a fine beach, broad esplanades and splendid bathing and boating. Charles II established the first dockyard here. In 1667 the town was captured by the Dutch admiral De Puyster. Pop. 17,500.

SHEERS, an engine used for hoisting masts and spars in shipbuilding and rigging. It consists of two or more poles or spars fastened together near the top and having their lower ends apart, somewhat in the shape of a narrow A. The apparatus is raised on a slant and is steadied by guy ropes, the base being fastened to the dock or ship on which it is used. From the top depends the tackle necessary for hoisting. Sheers are used on ships, docks and about shipyards for lifting heavy weights, guns, boilers or other machinery, spars and masts. When a mast is to be stepped or to be taken out, the sheers are mounted straddling the ship with the two base ends lashed to the deck on either side and the whole structure slanting so that its top is over the mast to be lifted or over the place into which it is to be dropped. Sheers used to be mounted on an old hulk or a ship cut down at one side so as to receive them; such vessels were called sheer hulks. They are little used in modern shipbuilding, their work being performed by permanent sheers on the docks or by the electrical cranes in the shipyards.

SHEET, generally speaking, a broad, flat surface; specifically a large stretch of water or ice; a large flat portion of some substance whose thickness is insignificant compared to its length and breadth, as a sheet of metal, of cardboard, etc.; a large rectangular piece of linen or like material used to cover the body during sleep, and thus a portion of the clothing of a bed; as applied to stationery, a large piece of paper either folded or unfolded; nautical, a sail, also the rope attached to the clew of a sail. There are some substances to which the name sheet is not applied. Thus we speak of a board and not of a sheet of wood, no matter how broad, flat and thin it is; we do not speak of a level field as a sheet of ground,

although we would speak of a pond in the field as a sheet of water; neither do we say a sheet of glass (except rarely) but a pane. The compound sheet-glass, however, is commonly used. As applied to paper sheets follow two nomenclatures. Blank sheets of the stationers' trade are known by arbitrary names given to certain sizes, such as cap, legal cap, royal, demi-royal. But printed sheets are denoted, as to size, by an ancient system of Latin nomenclature, based on the number of folds required to bring to that size a sheet of certain dimensions. Thus a quarto is a sheet made of four folds, an octavo of eight, a duodecimo of 12, etc. (See Book). From this idea of a folded, printed piece of paper a newspaper is often called a sheet, so, also, the leaves of books before bound, when the book is said to be "in sheets." A sail is called a sheet because it is made from a sheet of canvas and because it is broad, flat and thin. The rope called a sheet (abbreviated from sheet-rope) is used to hold a sail tight, extended against the wind, or to haul it around and change its position. This sheet is sometimes a chain.

SHEFFIELD, shěf'ēld, Joseph Earle, American merchant and philanthropist; b. Southport, Conn., 19 June 1793; d. New Haven, Conn., 16 Feb. 1882. In 1813 he became a partner in a New York mercantile house, but subsequently removed to Mobile, Ala., where he acquired large interests in the cotton trade. From 1835 he was resident at New Haven, where he helped to obtain the charter for the New York and New Haven Railway, visiting London to secure the co-operation of capitalists. He also built the Chicago and Rock Island line. By his gifts and bequests of more than \$950,000 the scientific department of Yale, since known as the Sheffield Scientific School, was reorganized and enlarged. See YALE UNIVERSITY.

SHEFFIELD, Ala., city in Colbert County, on the Tennessee River and on the Louisville and Nashville, the Northern Alabama and the Southern railroads, about two miles west of Tuscumbia (q.v.), the county-seat, and opposite Florence. Sheffield is one of the new cities of the South, founded in 1884 as a result of the great manufacturing movement. It is in an agricultural region in which there are large deposits of iron ore. There are five large blast furnaces, machine shops, cotton gins, cotton compresses and a grist-mill. There are several churches, a high school, public graded schools and several private schools. Pop. 4,865.

SHEFFIELD, England, city in the county of York, West Riding, at the junction of the Sheaf and the Don rivers, on several slopes surrounded by wooded hills. The suburbs are attractively built, with many terraces and elegant residences. There are a great number of churches, chief of which is the parish church erected under the reign of Henry I, which contains some interesting monuments; Saint Paul's, a good specimen of the Grecian; Saint James'; Saint George's; Saint Philip's and Saint Mary's, having exterior ornamentations of gargoyles, etc., and a graceful interior with a lofty and richly groined roof. The other buildings include the town-hall, council hall and municipal offices, Corn Exchange, Norfolk Market, Theatre Royal, Athenæum, libraries, association

halls, Mechanics' Institute, Albert Hall, Music Hall, Saint George's Museum, the Mappin Art Gallery and various others. The barracks are surrounded by extensive grounds. There are numerous hospitals and several monuments. Of educational and literary institutions the principal are Firth College; Wesley Ranmoor Methodist and People's College; grammar-school, public schools, art school, technical school; literary and philosophical institutions and museums. The University of Sheffield was founded in 1905 and is attended by over 1,500 students. The town enjoys all modern improvements. There are extensive botanical gardens. The Sheffield cutlery is celebrated, and all its manufactures of steel are famous, including heavy steel branches, such as armor plates, rail, large castings for engines, steel for rifles, etc. The other industries include the manufacture of optical instruments, iron and brass foundries, various mills, etc., besides silver plating, bicycles, cabinet-work, tanning, etc. Sheffield was in early times a Roman station and was an incorporated town under the Anglo-Saxons. In the 14th century it was already noted for its cutlery. Its history is also connected with the persecutions in the Netherlands, having been the refuge of victims suffering persecution under the Duke of Alva, who introduced their mechanical skill into the country. It developed rapidly in the 19th century, and became one of the greatest manufacturing cities of England. It was the first city of England to operate its street railway system. The electric-lighting and power plant, markets, artisans' dwellings, baths, free libraries, are also owned by the municipality. It sends five members to Parliament. Pop. 454,632. Consult Gatty, 'Sheffield, Past and Present' (London 1873).

SHEFFIELD PLATE. Of late years there has been a great interest in old Sheffield plate, which is now practically a lost art. Collectors pay large sums for specimens, which, a couple of decades ago, could be purchased for the proverbial "song." Some connoisseurs prefer the peculiar lustrous quality that the mixture of copper and silver gives to silver itself; others are charmed by the models produced in this special ware. Notwithstanding the fact that many old families possess a few specimens of Sheffield plate, comparatively few persons know much about it, for the question has been little studied. At the present moment the collecting of Sheffield Plate has become something of a fad and "antique" shops tempt the buyer with real and spurious articles.

Old Sheffield Plate is a term used to describe articles of flat or hollow ware for table or domestic use made of copper coated with silver by fusion. In Sheffield Plated Ware the silver was laid on both sides of a sheet of copper, something like a sandwich with the copper in the middle, and the two metals, united by fusion, were then hardened by pressure between rollers. Hence its old name of "Copper Rolled Plate," which describes it exactly. Sheffield Plate appears as a new invention in England in the year 1742; but it is more than likely it was a rediscovered process, for the art of imitating silver had reached a state of excellence in the 15th century. The art of imitating gold and silver was known to ancient nations. Assyrians, Egyptians and Hebrews

were most skilful in the use of metals and in fine wire-work. The Romans left definite instructions regarding the application of gold and silver to articles of tin or copper and copper vessels coated with silver have been found at Herculaneum. The ancient Mexicans and Peruvians also made imitations of gold and silver and articles have been found in Peru that are silver plated on copper by a process very like that of Sheffield plating—the two metals having been amalgamated by heat. Sheffield Plate, or, to speak more correctly, Sheffield Plated Ware, dates from about 1743 and lasted for 100 years until it was superseded by electroplating about 1840. Sheffield in the reign of Queen Elizabeth was famed for its cutlery and also the fine parks, gardens and country-seats in its vicinity. Sheffield is now a place full of dirt and smoke, caused by the factories and iron and steel works. In 1742 Thomas Bolsover, a mechanic, was repairing the handle of a knife, which was composed partly of silver and partly of copper, when he accidentally fused the two metals. This showed him that it was possible to coat copper with silver in such a way as to form a cheap and durable metal presenting an exterior of silver only. He immediately began to manufacture articles of this kind (copper plated with silver), but he confined his efforts to small objects, such as buttons, snuff-boxes and other light and small articles. Then Joseph Hancock took up the business and began to imitate the finest and most richly embossed plate. Thus every kind of domestic article that had decorated the side-board and buffet, which until then had been made of wrought silver only, was imitated in copper Rolled Plate.

Naturally, the new process was hailed with delight by the middle class, for it was possible now for people of ordinary means to have shining Sheffield Plated Ware who had heretofore contented themselves with pewter. The trade developed to such an extent that it was difficult to fill the orders that came from all parts of England and her colonies. The new process was also carried to Birmingham, London, Nottingham, Scotland and Ireland. Dublin became quite a centre for the new manufacture. Sheffield plate was also made in America.

The Sheffield manufacturers produced tea-urns, coffee and tea-pots, tea-kettles and lamps, epergnes, tankards and measures of all sizes, jugs, cups, goblets, tumblers, candlesticks, candelabra with branches, cruet frames, water and platter plates and dishes, dish-rims, crosses, tea-trays and waiters, bottle-stands, writing-stands, tureens, ladles, spoons, scallop-shells, canisters, mustard-pots, argyles, snuffer-trays, wine-funnels (round and oval), salt-cellars, bottle-labels, decanter-labels, cream-labels, bread and sugar baskets, skewers, lemon-strainers, cheese-toast-ers, chocolate pots, saucepans, stewpans, snuff-boxes, bridle bits, stirrups, buckets, spurs, knife and fork handles, buttons for saddles and many other small articles.

Horace Walpole, writing in 1760, says: "As I went to Lord Stafford's I passed through Sheffield. One man there has discovered the art of plating copper with silver. I bought a pair of candlesticks for two guineas; they are quite pretty." Classification is difficult because the dealers have, unfortunately, divided up Sheffield in a way rather misleading to the

historian and art-critic. Dealers have named the first examples of Sheffield "Queen Anne," which is absurd, because Sheffield plated ware began in the reign of George II. However, as dealers' names appear in catalogues of auction sales, etc., it is well to understand that what they mean by Queen Anne is applied to designs of the Queen Anne type, rather short and squat models in which the gadroon is the chief ornament. Dealers divide Sheffield plated ware into five periods: (1) Queen Anne; (2) early Georgian; (3) late Georgian; (4) Empire; and (5) Late. Sheffield Plated Ware followed all the styles that the silversmith introduced. Consequently the early and late Georgian show Louis XV and Chippendale styles and Louis XVI designs. The third period, from 1770 to 1785, is the most attractive of all because of the delicate and slender oval and the charming style of Adam, Heppelwhite and Sheraton ornamentation. Next comes the Empire style; and, finally, the last period, which is ornate and florid; but not by any means to be despised, because very splendid things were produced. The wire-work dates from 1790 to 1810. The perforated pieces come later. As a rule, the borders are of solid silver. In the earliest pieces the edge consists of a solid silver thread, or several threads; then comes the gadroon (or fluted) edge; then the gadroon and shell; and then the florid. Sheffield Plated Ware was often beautifully engraved.

Collectors should notice the difference between "Old Sheffield Plated Ware" which is silver-plated copper, and modern Sheffield Plated Ware, which is copper electro-plated. Counterfeit articles are made of copper and electro-plated.

Two or three points form a good test of the genuineness of old Sheffield Plate. One is the presence of embossed relief work of solid silver on all ornamented articles. Another test is the bands or narrow strips of silver to be found wrapped round the edges and under the mounts, which are put there to conceal the joints and bare edges of the copper. Another reliable test is the inlaid shield.

Nothing was hall-marked until 1784. Manufacturers also had special devices, viz., W. and G. Sissons, a bell; Watson, an open hand; Fenton Creswick and Company, crossed arrows; Boulton Bingham, ball and horseshoe; Walker Knowles and Company, ball and cross; Daniel Hoyle and Company, pineapple; Wilkinson and Company, cross keys, and so on. The chief authority is Bradbury's 'History of Old Sheffield Plate' (London 1912). Consult also Veitch, H. N., 'Sheffield Plate' (London 1908); and Wylie, Bertie, 'Sheffield Plate' (London and New York 1907).

ESTHER SINGLETON.

SHEFFIELD SCIENTIFIC SCHOOL, a department of Yale University. See YALE UNIVERSITY.

SHEIK, shēk, an Arabic word signifying an aged man or elder, is used generally as a title of reverence and has come to acquire a great variety of significations. Among the Bedouins and other migratory tribes where patriarchal government prevails, the head of every tribe is called a sheik. The superiors of the Mohammedan religious or monastic orders are called sheiks. The chief mufti is called

sheik-ul-islam. In general the title is given to learned men, and by a wider extension is used as a common title of courtesy, like Mr.

SHEIL, shēl, Richard Lalor, Irish orator, dramatist and politician; b. Drumdowney, 17 Aug. 1791; d. Florence, Italy, 25 May 1851. He was educated at Stonyhurst College and Trinity College, Dublin, studied law at Lincoln's Inn and was called to the bar in 1814. His progress in his practice was slow and he turned to dramatic writing, having already produced a moderately successful drama, 'Adelaide' (1814). A tragedy, 'The Apostate,' was produced in 1817, and ran through the season. He produced 'Bellamira, or the Fall of Tunis' (1818); 'Evadne' (1819); 'The Huguenot' (1822), and with John Banim, 'Damon and Pythias.' Of these 'Evadne' is considered the best. He next joined with Curran in contributing to the *New Monthly Magazine* the 'Sketches of the Irish Bar.' In 1825 he visited London with O'Connell, O'Gorman and others to protest against the bill that had been introduced for the suppression of the Catholic Association, and during the progress of the agitation continuing until 1829 spoke many times in public meetings in Ireland in behalf of the Irish cause. When emancipation was finally secured, Sheil moved the dissolution of the Catholic Association. In 1830 he entered Parliament from Milbourn Port in Dorset, sat for County Louth in 1831 and in 1833 was member of the first reformed Parliament for County Tipperary. He gradually withdrew from a close identification with the Irish cause and turned his attention more to the foreign policies of the empire. Shortly after the accession of William IV he became commissioner of Greenwich Hospital, but later exchanged this post for the vice-presidency of the Board of Trade. In 1846 he was appointed master of the mint and his inability to move in the relief of the famine in Ireland, though not thoroughly understood in that country, yet diminished his popularity. His last appointment was that of Minister to the court of Tuscany in 1850. He was brilliant in Parliamentary speaking, though he lacked spontaneousness, and carefully prepared each address. Of his forensic speeches that delivered as counsel for John O'Connell at the "monster trials" in Dublin in 1844 is accounted his best. His 'Speeches' was edited by McNevin (Dublin 1845). Consult McCullagh, W. T., 'Memoirs of Richard Lalor Sheil' (London 1855).

SHEKEL, a unit of weight supposed to have been first used in Babylonia and afterward by the Jews and other peoples; also a coin used by the Jews and thought to have been introduced by Simon Maccabæus. The weight was reckoned as one-sixtieth part of a maneh, and afterward was revised by the Phœnicians to be one-fiftieth part of a maneh (then called mina). It is probable that the shekel, with other measures of weight, underwent much revision as to size, shape and weight. Phœnician shekels are found in the following weights: 234 grains (Troy), 224 grains, 218 grains, 208 grains. The Assyrian shekel was of 129 grains; their double shekel of 258 grains. The Jewish shekel was of 218 grains.

The use of the shekel as money among the ancient Hebrews is popularly supposed to date with Simon Maccabæus, to whom was given

(1 Mac. xv, 5) the power "to coin money for thy country with thine own stamp." Whether or not Simon made use of this privilege is disputed by some authorities, but it is generally conceded that either he or his son coined the first native Hebrew money. This was about 141 B.C. The shekel seems to have been of gold, copper or silver, and originally of a shekel in weight. The gold shekel was worth about \$5.69, the copper about three cents and the silver shekel about 54 cents. The silver shekel seems to have been the most used. A common example of it shows on one side a pot of manna, or sacred bread, with the legend "shekel of Israel"; on the reverse a flower figure, supposed to have been a representation of Aaron's rod budding, and the legend "Jerusalem the holy." The shekel of the sanctuary (Ex. xxx, 13) or temple tax was supposed, for a long period, to have been a special coinage, but it is now believed to have been the silver shekel of the country. Consult article "Money" in Hastings' 'Bible Dictionary' (New York 1900); Madden, F. W., 'Coins of the Jews' (London 1881); Reinach, T., 'Jewish Coins' (1903).

SHEKINAH, *shē-kī'nā*, a post-Biblical abstract term, signifying "he who dwells," from the Biblical *Shakan*, to dwell, employed as a substitute for God to avoid certain anthropomorphic words in the Bible. It is used particularly in such passages where God is mentioned as dwelling either in the tabernacle or among the people, to express the majesty of the divine presence. It was used primarily to soften terms applied to God and to prevent by a kind of periphrasis false views as to His manifestations in the popular mind. At the root of its employment was the innate antagonism of the Israelite to any materialistic conception of the divine. It is found most frequently in the Targumim or Aramaic paraphrases of the Old Testament, written when Hebrew had ceased to be the popular language.

A few illustrations will make the usage clear. The Targum of Onkelos renders the sentence (Ex. xxix, 45) "And I will dwell among the children of Israel and be their God," as "And I will cause my Shekinah to dwell." In Isaiah (xxxiii, 17), "thine eyes shall see the King in all His beauty" became "Thine eyes shall see the Shekinah of the King of the worlds in His beauty." Onkelos translates "Elohim" in Gen. ix, 27 by "Shekinah" or whenever the person, dwelling, radiant majesty of the divine is mentioned. Even the temple of Solomon is called "the house of the Shekinah," which also took the place and meaning of the Aramaic *Memra* "name," *logos* and *Yekara*, "glory" in Talmud and Midrash. It is employed, too, in the New Testament—the Greek word for "glory" *doxa* being regarded as equivalent to Shekinah. G. H. Box gives as the most notable passage Romans, ix, 7, where Paul, mentioning the privileges of Israel, states "whose is the adoption and the glory," the visible presence or Shekinah of God among His people.

As to the nature of the word, it sprang into usage in a polemical era. Rabbinical opinions have not been unanimous. Schechter seems to regard as unfortunate the attempts of the rabbis to allegorize in the days of other and more aggressive philosophies. "What to and rabbis

was a simple adjective, a reverential expression, or a poetical metaphor turned into the hands of the Hellenists into a new deity an aeon, or a distinct Emanation," as he writes in 'Some Aspects of Rabbinic Theology' (p. 43). In later centuries Maimonides in his 'Guide to the Perplexed,' which sought to interpret the law of Moses by the logic of Aristotle or to co-ordinate both philosophies, considered the Shekinah as a distinct entity, a light proved to be intermediary between God and the world. On the other hand, Nachmanides deemed it the essence of God manifested in a distinct form. An attempt has been made by Weber to differentiate the Talmudic from the Targumic conception of the Shekinah but without success. The difficulty of an exact definition is due not only to the fact that diverse ideas have been associated with it, but to the circumstance that in rabbinical literature, extending over many centuries, the utmost freedom of opinion is exercised and full citations must be given to understand aright their views. In their homiletical interpretations in particular the rabbis were rich and naïve in fancy.

ABRAM S. ISAACS.

SHELBURNE, *shēl'bērn*, William Petty Fitzmaurice, LORD, 1st Marquis of Lansdowne; b. Dublin, 20 May 1737; d. London, 7 May 1805. He entered Oxford, but two years later left the university and entered the army. While engaged in the campaign in Germany he was returned to the House of Commons for High Wycombe in 1760, and was re-elected in the following year. He was also elected to the Irish Parliament, but he never sat in either body, for the death of his father in 1761 elevated him to the House of Lords. He was frequently employed by Butte as a negotiator in political combinations and on 30 April 1763 he became president of the Board of Trade and Foreign Plantations with a seat in the Cabinet; but his speech in the debate on the proceedings against Wilkes caused his dismissal from his staff appointment. In April 1764 he took his seat in the Irish House of Lords as Earl of Shelburne, and in 1766 took a leading part in the English Parliament in the repeal of the Stamp Act. Under Pitt he became Secretary of State for the Southern Department (23 July 1766), and in the following month the entire control of the administration of the colonies was placed in his hands. He endeavored to pursue a conciliatory policy toward the American colonies, but in this was thwarted by his colleagues, and in January 1768 was superseded by Lord Hillsborough. He stood alone with Chatham against coercing the American colonies, but his opposition was unavailing. In his Parliamentary speeches, many of which became famous, he always opposed the coercive measures of Lord North's ministry, recommended measures for ending the hostilities in America, but declared he would never consent to the acknowledgment of American independence. When Lord North resigned in March 1782 Shelburne declined the

king's invitation to form a new ministry, but acted as intermediary in pressing the post upon Rockingham. In the Cabinet formed by the latter he became Secretary of State for Home Affairs, and tried to introduce several economic reforms. Rockingham's death occurred in July of that year and Shelburne accepted the duty of forming a government. In this ministry William Pitt, then only 23, became Chancellor of the Exchequer. In the debate on the change of ministry Shelburne declared that he still adhered to all the constitutional ideas that he had imbibed from his master in politics, Lord Chatham, and that he had not altered his opinion concerning American independence; but during the negotiations of the Peace of Paris he was reluctantly led to agree to the concession. The coalition of North and Fox against his government led to his resignation 24 Feb. 1783. In December 1784 he became Marquis of Lansdowne in the English peerage. He was one of the most hated men of his time, a circumstance probably due to his independent spirit in party politics and his supercilious manners. Yet many of his views were more enlightened than his times. He advocated Parliamentary and economic reform, Catholic emancipation and religious equality and free trade. Disraeli said he was "the first great minister who comprehended the rising importance of the middle class." He patronized literature and the fine arts and his later years were largely devoted to his collection of books and pictures. Consult Fitzgerald, 'Fitzmaurice, Life of William, Earl of Shelburne' (1875-76; revised ed., London 1912).

SHELBURNE, Canada, capital of Shelburne County, Nova Scotia, a seaport town on the southwest coast at the head of a deep and capacious bay, forming one of the safest harbors of the province, 140 miles southwest of Halifax. Shelburne is a station on the Inter-Colonial Railway system and has an important maritime and transit trade. Ship-repairing docks and ironworks are the chief industrial establishments, and its fisheries are valuable. The Roseway River supplies abundant water-power. The entrance to the harbor is marked by a lighthouse on McNutt's Island; it exhibits two lights, the highest 120 feet above the sea. After the American Revolution the population of Shelburne was increased to about 12,000 by the advent of United Empire Loyalists. It has since declined in importance.

SHELBY, Isaac, American soldier: b. North Mountain, Md., 11 Dec. 1750; d. Traveller's Rest, Lincoln County, Ky., 18 July 1826. He became a surveyor and in 1771 removed to Tennessee. In 1774 he was appointed lieutenant in the company of his father, Gen. Evan Shelby, fought at the battle of Point Pleasant and remained in command of the fort there until 1775. He was engaged at the battle of Long Island flats where his valor won the day, became commissary of the frontier in 1777 with rank as captain, in the succeeding year was promoted colonel, and also served as a member of the Virginia house of delegates in that year. He planned the important action at King's Mountain in 1780, served under Marion in 1781 and under Greene in 1781-82, and was a member of the North Carolina legislature in those years. He was a member of the Constitutional Con-

vention in 1791 and was elected the first governor of Kentucky in 1792, served until 1796 and again in 1812-16. He recruited and led 4,000 men to the relief of General Harrison in Canada in the War of 1812, receiving a gold medal from Congress for his services. He declined the office of Secretary of War in 1817 and afterward lived in retirement, though he acted as commissioner with General Jackson in negotiating the treaty with the Chickasaw Indians in 1818. Nine counties in the Southern and Western States are named in his honor, as is also a college at Shelbyville, Ky.

SHELBYVILLE, Ill., city, capital of Shelby County, on the Kaskaskia River and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Chicago and Eastern Illinois railroads, about 45 miles southeast of Springfield and 33 miles south by east of Decatur. It is in a fertile agricultural region in which considerable attention is given to stock-raising, lumbering and coal-mining. The chief manufacturing establishments are flour-mills, foundry, lumber-mills, agricultural implement works, gasoline engine manufactories, a woolen-mill and creameries. There is considerable trade in farm and dairy products, livestock and coal. Pop. 3,590.

SHELBYVILLE, Ind., city, county-seat of Shelby County, on the Big Blue River and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Pittsburgh, Cincinnati, Chicago and Saint Louis railroads, about 26 miles southwest of Indianapolis and 90 miles north of Louisville, Ky. It is in an agricultural and stock-raising region. The chief manufacturing establishments are 18 furniture factories, flour-mills, creameries, barrel factories, lumber and planing-mills, paper products mill, glove factory and fireless-cooker plant. It is the commercial and industrial centre for Shelby County and has considerable trade in farm and dairy products, livestock and manufactures. There are 12 churches, 10 public schools and one parish school and a public library. The three national banks have a combined capital of \$300,000; there are several building and loan associations and one private bank. The city has had a steady growth, mainly due to the general development of the surrounding country. Pop. 12,500.

SHELBYVILLE, Ky., city, county-seat of Shelby County, on the Southern and the Louisville and Nashville, and the Chesapeake and Ohio railroads, about 28 miles east of Louisville and 21 miles west of Frankfort. It is in an agricultural and stock-raising region. Shelby County is known as the Jersey Isle of America, on account of the large number of blooded Jersey cattle. Large quantities of tobacco in the vicinity are prepared for market and shipped from Shelbyville. It has a flour-mill, creameries, machine shops and cigar factories. The educational institutions are a high school, elementary schools, Science Hall School for Girls, Stuart Female College, founded in 1839, Shelbyville Academy for Boys, opened in 1881. Five banks have a combined capital of \$425,000. The government is vested in a mayor and a common council. A sum of \$85,000 will be expended by the government in a new post-office building. Shelbyville is one of the richest

counties in the State—has over 400 miles of macadamized roads. Pop. about 5,000.

SHELBYVILLE, Tenn., town, county-seat of Bedford County, on the Duck River and on the Nashville, Chattanooga and Saint Louis Railroad, about 65 miles south by east of Nashville. In June 1863 the town was the scene of military operations and during the greater part of the Civil War Shelbyville and vicinity were scenes of many skirmishes. It is in an agricultural and lumbering region and in the vicinity are several varieties of good building stone. The chief manufacturing establishments are foundries, machine shops, lumber and planing mills, a large lead-pencil factory, cotton and woolen mills and a flour mill. The chief products shipped are pencil-cedar, telegraph and telephone poles, grain and mules. There are six churches, graded public schools and the Shelbyville Female College, founded in 1853. Pop. about 3,000.

SHELD-DRAKE, or **SHELDRAKE**, a sea-duck (*Tadorna cornuta*) of the cooler parts of the Old World, which frequents sandy shores and makes its nest in burrows in sand-dunes, earthen cliffs, old rabbit-warrens, etc. It is of large size and very handsome plumage; head and upper neck dark, glossy green, broad white collar below, with a broader band of bright bay extends from the back across the breast. It is somewhat larger than an ordinary duck and the female is smaller and less brilliantly colored. In the Frisian Islands and some other parts of the world the people provide it with acceptable artificial breeding-burrows and take a portion of its eggs and down, so making an annual profit from the arrangement. Several other species of the same genus are found throughout Africa, southeastern Asia and Malaya, one of which is well known in India as the Brahming duck. Much ornithological interest attaches to these birds and the name itself is a matter of curious speculation, for which see Newton, 'Dictionary of Birds' (New York 1896).

SHELDON, Charles Monroe, American Congregational clergyman and author: b. Wells-ville, N. Y., 26 Feb. 1857. He was graduated from Brown University in 1883, from the Andover Theological Seminary in 1886, was ordained in 1886 to the Congregational ministry and in 1889 became pastor of the Central Congregational Church of Topeka, Kan. In 1900 he attracted considerable attention by his connection with the Topeka *Capital*, of which he took entire charge for one week, and which he published as a distinctively Christian daily after principles enunciated in his book, 'In His Steps' (1896), a work of excellent intention, but no literary importance, which was sold very extensively. Among other volumes by him are 'Robert Hardy's Seven Days' (1892); 'Malcolm Kirk' (1897); 'The Wheels of the Machine' (1901); 'The Narrow Gate' (1902); 'The Heart of the World' (1904); 'Richard Bruce,' 'The Reformer,' 'The Crucifixion of Philip Strong,' 'The High Calling,' 'John King's Question Class,' 'The Twentieth Door,' 'For Christ and the Church,' 'One of the Two,' 'His Brother's Keeper,' 'A Builder of Ships,' 'The Miracle at Markham,' 'Born To Serve,' 'Jesus is Here!' 'Of One Blood.'

'In His Steps,' "a work of excellent intention, but no literary importance," has been

translated into 24 languages and published by 100 different publishers who have sold 20,000,000 copies, with no pecuniary benefit to the author as the book was not copyrighted. In 1912 Mr. Sheldon resigned his pastorate of Central Congregational Church and became "Minister at Large." In 1915 he was recalled as pastor, and is now (1916) serving in that capacity.

SHELDON, Edward Brewster, American dramatist: b. Chicago, 14 Jan. 1886. He was graduated at Harvard University in 1907, and took his A.M. there in 1908. His first play, 'Salvation Nell' (1908), in which Mrs. Minnie Maddern Fiske starred, was written while he was pursuing post-graduate studies at Harvard. Author of 'The Nigger' (1909); 'The Boss' (1912); 'The High Road' (1912); 'Romance' (1913); 'The Song of Songs' (1914); 'Garden of Paradise' (1915), etc.

SHELDON, Edward Stevens, American philologist: b. Waterville, Me., 21 Nov. 1851. He was graduated at Harvard University in 1872, and later studied at the universities of Berlin, Paris and Leipzig. From 1877 he was connected with the modern languages and Romance philology departments at Harvard, and since 1894 he has been professor of Romance philology there. Author of 'A Short German Grammar' (1879), and joint author of 'Concordanza delle opere italiane in prosa e del canzoniere di Dante Alighieri' (1905).

SHELDON, Henry Clay, American Methodist Episcopal theologian and educator: b. Martinsburg, N. Y., 12 March 1845. He was graduated at Yale University in 1867 and at the Boston University School of Theology in 1871, was ordained and served as a pastor in 1871-74. He was professor of historic theology at the Boston University School of Theology in 1875-95, and thereafter was professor of systematic theology there. Author of 'History of Christian Doctrine' (2 vols., 1886; 4th ed., 1906); 'History of the Christian Church' (5 vols., 1894); 'A History of Unbelief in the Nineteenth Century' (1907); 'A Fourfold Test of Mormonism' (1914); 'Studies in Recent Adventism' (1915), etc.

SHELDON, Lionel Allen, American soldier, lawyer and administrator: b. Otsego County, N. Y., 30 Aug. 1831. After studying at Oberlin College he was admitted to the bar in 1851, and began practice in Elyria, Ohio. In 1856 he was a delegate to the Philadelphia Republican Convention and there supported John C. Frémont as its nominee for President. In 1861 he was commissioned a brigadier-general of militia, and in that capacity raised many recruits for the Union army. He was made colonel of the 42d Ohio Infantry in 1862; won distinction in the battles of Chickasaw Bayou and Arkansas Post; and took part in the capture of Vicksburg. He was brevetted brigadier-general of volunteers in 1865. After the war he removed to New Orleans, where he practised law; was a Republican member of Congress in 1869-75; and governor of New Mexico in 1881-85.

SHELDON, Samuel, American electrical engineer: b. Middlebury, Vt., 1862. He was graduated at Middlebury College in 1885, and from the University of Wurzburg in 1888. He was assistant in physics at Harvard University

in 1888-89, and since 1889 has been professor of physics and electrical engineering at the Brooklyn Institute of Arts and Sciences. In 1903 he was appointed an expert in the Swiss department of justice and police. Author of 'Dynamo Electric Machinery' (1900; 9th ed., 1915); and joint author of 'Alternating Current Machines' (1902; 9th ed., 1911), and 'Electric Traction and Transmission Engineering' (1911).

SHELIF RIVER (French *Chélif*, shāl-ēf), Algeria, a river rising on the Atlas Range and flowing north into the Mediterranean Sea, which it enters near Mostaganem. It traverses the great central plateau, and then flows for a considerable distance westward, parallel with the coast, through a fertile longitudinal valley between the two coast ranges. It is 400 miles long, and the largest river in the colony.

SHELL. See PROJECTILES.

SHELL, the external limy, chitinous or silicious integument or covering of such invertebrate animals as form a hard exoskeleton; or some structure resembling the armor of a mollusk. Thus, broadly, the term applies to the protective envelope of eggs; the tests of foraminifers, polyzoans and echinoderms, the living tubes of annelids, the exoskeletal integuments of the crustaceans, the shards of beetles, and the egg-pouches and cuttle-bone of the argonauts and calamaries, as well as to the hard armor, or "shells" proper, brachiopods of mussels and snails. Whatever its form or homology, it serves the purpose of support and protection. The characteristic structure of the exoskeleton, tests and other "shells" of the invertebrates mentioned above are given in the articles on FORAMINIFERA, ECHINODERMATA, etc.; and the present treatise may be restricted to the shells of the *Mollusca*.

The shells of mollusks vary from entire absence, or a merely rudimentary condition, to highly elaborate and ornamental examples; and from almost microscopic minuteness and delicacy to massive structures completely enveloping and protecting the animal and weighing several hundred pounds. All are composed mainly of carbonate of lime, which in some cases, as the hard shells of the cameo-strombs, amounts to 99 per cent, while in others as much as 10 per cent may consist of other earthy salts, and a small amount of organic material called "conchiolin," which disappears as shells dry out after the death of their occupants. Various views have been held as to the formation of the shell, but it is plain that the mantle-margin is the principal agent in its deposition; accidental holes and breaks will be repaired elsewhere, and even the foot may secrete shelly matter, but regularly this is the function of the epithelial cells along the edge of the mantle, to separate the carbonate of lime from the blood and throw it out, where it crystallizes and cements itself into the required form as it exudes. This deposition is not continuous, but takes place at more or less regular periods or seasons, annually or semi-annually, alternating with seasons of rest. The additions to the shell made during each period of activity are often indicated by a thickened line forming a raised and more or less knobbed or irregular ridge called a varix. "The various details

of sculpture on the exterior surface of the shell—the striæ, knobs, nodules, imbrications, spines and other forms of ornamentation are all the product of similar and corresponding irregularities in the mantle margin and have all been originally situated on the lip. Spines, for example, those of *Murex* and *Pteroceras*, are first formed as a hollow thorn, cleft down its lower side, and are afterward filled in with solid matter as the mantle-edge withdraws. What purpose is served by the extreme elaboration of these spiny processes in some cases, can hardly be considered as satisfactorily ascertained. Possibly they are a form of sculptural development which is, in the main, protective, and secures to its owners immunity from the attacks of predatory fishes." (Cooke, 'Mollusca,' p. 256).

Three principal varieties of texture are perceptible in molluscan shells. The porcellaneous shells of gastropods consist of three layers, which consist of thin plates, placed side by side, the direction of the planes of these laminae being different in the different layers. Thus the plates may lie transversely in the central layer and horizontally in the others, or longitudinally in the middle and crosswise in the outer and inner layers. The nacreous shells form the second variety made up of numerous closely packed layers, the edges of which exhibit undulations of their surfaces. The lustre and prismatic hues of nacre are due to the minute striæ on the surface which break up and refract the light. (See PEARL). It is interesting to note that the nacreous type of shell occurs largely among mollusks which now represent very ancient forms. The fibrous shells are composed simply of successive laminae or layers of prismatic cells. In their living state shells are covered externally by a layer of animal matter, known as the periostracum, or epidermis, well seen in the fresh-water mussels, for example. This layer may, however, be so delicate as to be almost invisible to ordinary observation. The colors of shells are due to pigment deposited in the course of their growth from pigment cells situated along the mantle-margin. When the valves or pieces of which a shell is composed are equal in size the shell is denominated equi-valve; if more developed to one side of the middle line than to the other it is termed inequilateral. The prominent point of the shell is the umbo or beak; this always points in the direction of the mouth, and hence the part on which the mouth is situated is termed anterior; the opposite posterior. The part where the hinge is situated is the dorsal or upper border; the border opposite to this or that by which the shell opens, the ventral side or base. The length of a bivalve shell is measured from its anterior to its posterior margin; and its breadth from the dorsal to the ventral border. The shells of bivalved mollusks (pelecypods) are shut or drawn together by the action of either one or two adductor muscles. The impressions or "scars" of these muscles may generally be perceived on the interior of the shells, but in some cases (as in oysters) only a single adductor muscle is developed, this latter representing the posterior muscle of those forms possessing two. The forms with single muscles are named *Monomyaria*, those with two being termed *Dimyaria*. These shells are opened not by muscular action but by that of ligaments situated at

the hinge, one of which (the external ligament) is put on the stretch when the shell is closed, and opens the shell in virtue of its elasticity. The internal ligament is situated within the hinge, and usually in pits or depressions of the shell. This latter is also compressed when the shell is closed, and aids in opening the shell by its elasticity. The hinge may be curved or straight, and may exhibit sets of teeth springing from one valve and fitting into sockets on the opposite valve of the shell.

In gastropods the shell is typically a spiral univalve; and we may conceive of a simple conical shell (such as that of the limpet) being converted into a spiral form by supposing it to be first long drawn out, and then twisted upon itself from above downward, either to the right or left side. The apex of the gastropod shell is usually more or less oblique in position. The coils or whorls of the spiral shell may either be separated (as in *Vermetus*) or contiguous, and in close contact. Sometimes the whorls lie in one and the same plane, being coiled round a central axis (as in the fresh-water *Planorbis*), and then the shell is named discoidal. But generally the gastropod shell shows the whorls to be wound in an oblique manner, so as to form a true spiral and shells with this conformation may, therefore, be named trochoid, turreted, turbinate, etc. An ordinary gastropod (or snail) shell shows the whorls wound round a central axis or columella; the nucleus or apex being formed by the shell of embryonic life, and the largest or terminal whorl (body whorl) showing the mouth or aperture, which may exhibit various dentations of its margins. When the columella or axis of the shell is hollowed, and opens below at the mouth-aperture, the opening is named the umbilicus; but it may also be solid and imperforate. If the aperture or mouth of the shell is notched for the passage of one or more siphons, the shell is said to be siphonotomatous. If, on the contrary, its margin is unbroken and entire, the shell is holostomatous.

The shells of *Pteropoda* are generally of delicate glassy structure, and consist either of a dorsal and ventral or united plate, or of a spiral shell. In some extinct forms (for example, *Conularia*) of *Pteropoda* the shell was of large size and of quadrate shape.

The *Cephalopoda* or cuttlefishes possess (as in the *Tetrabranchiata*; see NAUTILUS) external many-chambered shells, or, as in ordinary cases, internal shells, which may be destitute of chambers, or chambered as in the extinct *Belemnites* or in the existing *Spirula*. In the argonaut (q.v.), the shell is external, but single-chambered; and is, moreover, not a true shell, but a foot-secretion of the female only, formed not by the mantle but by two of the feet or arms, which are specially expanded and modified for this office; and the office of which is the safety of the developing eggs.

SHELL, Its Industrial Uses. It may surprise some to learn that shells rank among the principal "fishery" products of the world. This refers to those used for industrial purposes and not to the large supplies for museum and cabinet collections. In London the sales of pearl shells or mother-of-pearl amount to about \$4,000,000 each year, and the annual imports of this material into the United States before the war exceeded \$1,000,000 in value.

The shells caught in this country aggregate about 1,000,000 tons annually. The economic utilization of these is more diversified than is generally supposed, giving employment to many thousands of persons, and constantly increasing in importance. The most valuable item in shell production is mother-of-pearl. The most important is the pearl oyster found in many inshore tropical waters of both continents. The shells vary greatly in color and iridescence, but three general classes are recognized, namely, white or silver-lipped, yellow or golden-edged and smoky or black-edged; the last yielding the so-called "smoked" mother-of-pearl.

The white shell has the silvery lining uniform over the surface, and as it may be cut up to greater advantage, it is the most valuable. When black pearl buttons are fashionable, the black-edged shell sells almost as high as the best white shell. A fair valuation of mother-of-pearl shells is \$40 per ton, though the choicest sell for upward of \$1,500 per ton.

During recent years large quantities of low-grade pearl shell have been secured from the fresh-water mussels of the United States. These occur principally in the Mississippi River from Prairie du Chien, Wis., to Quincy, Ill., and to a much less extent in adjoining waters. Though their utilization originated so recently as 1891, the present annual product is very large, exceeding 20,000 tons during certain years. The value is much less than that of choice pearl shell, selling usually for less than \$25 per ton.

Many univalve shells are sufficiently nacreous and iridescent to be used as mother-of-pearl, especially abalones, top-shells, "green snail" shells, etc. In variety and intensity of coloring the pearly lamina of some of these exceeds that of the pearl oyster. However, the coloring is not so harmonious nor is the shell so thick and flat as in the pearl oyster, consequently they are not desirable for many purposes for which the latter are employed.

Mother-of-pearl is used in the manufacture of a great variety of articles for which it is peculiarly adapted by reason of its hardness and beauty. Most important of these are buttons, knife handles, parasol handles, buckles, penholders, pistol stocks, etc. It is also used for inlaying and for covering opera glasses, card cases, etc. In the aggregate a very large number of persons are given employment in working up this material. Formerly the business was centred at Birmingham, England, and Vienna, Austria, 4,000 persons being thus employed at the former place a few years ago; but it has gradually extended to other localities, especially in France and the United States. It is claimed that about 8,000 persons are employed in working pearl shell in Austria, 5,000 in England, 4,000 in France, 3,500 in America, and many in various other countries. The manufacture of pearl buttons in this country from domestic shells dates from 1891 and is already of very great extent, the 60 factories giving employment to about 2,500 persons and using 12,000 tons of shells annually, yielding about 600,000,000 buttons.

Pearl shell is much used for inlaying, especially of musical instruments, jewelry boxes, domestic furniture, church vestments, etc. Artistic work of this nature is done in the United States as well as in Europe and Asia. The shell is cut in simple patterns and is also used

in floral and in arabesque designs. For this purpose the brilliantly colored abalone shell is used with beautiful effect, especially when combined with white shell. Some very elaborate work of this nature is done. A mandolin recently exhibited in this country contained more than 2,000 pieces of four different kinds of shell, and 225 days' work were expended in cutting and finishing the pieces, the whole representing an investment of \$1,500. Some years ago there was exhibited in New York a piano, the entire keyboard of which was of pearl. The body of the keys was of ordinary white shell and the flats and sharps were of green abalone, the effect being extremely rich and pleasing.

The most abundant shells in America are those of oysters and clams, especially the former. The product of these approximates 40,000,000 bushels annually and the purposes to which they are applied are numerous. The most important use is in road-making. At various points on the Atlantic seaboard, and particularly in the Chesapeake and the Delaware bay regions, many miles of good roads have been made of this material. It is estimated that 3,000 miles of roads on the Atlantic Coast have been surfaced with shells. Connecticut, Long Island, southern New Jersey, Delaware, Maryland, Virginia, North Carolina and Louisiana contain many excellent examples of oyster shell roads. To cover a road 16 feet wide to a depth of 15 inches in the middle and eight inches at the sides requires about 30,000 bushels of shells per mile, costing on an average of four cents per bushel or a total of \$1,200 per mile. To keep such a road in good repair requires about 2,500 bushels of shells per mile annually at a cost of about \$100. Though they constitute the cheapest and most convenient material in the sections where they are commonly used, shells are not wholly satisfactory for road material owing to their rapid wear and the spreading of objectionable lime dust.

Oyster shells have been largely employed as ballast for beds of railroads. While not nearly so durable or steady as rock, they answer the purpose fairly well and are the most convenient and economical material in many localities. Examples of their use for this purpose occur on many of the railroads in Maryland, Virginia and Louisiana.

Oyster shells have been extensively used as a source of lime, especially for agricultural purposes, as well as in masonry. Most of the brick buildings erected in colonial times were solidified with shell lime. Owing to its tendency to absorb moisture and thus make the houses damp its use for this purpose was abandoned soon after the discovery of limestone in abundance. The quantity of burned oyster shells spread on farming lands amounts to many thousands of tons annually. These shells are also crushed into small particles and fed to chickens to improve their digestion and their egg laying. This use is increasing in popularity. Oyster shells are also employed in the manufacture of certain special grades of steel owing to their large content of carbon.

A somewhat recent use for shells in America is for spreading on private oyster grounds for the purpose of obtaining a "set" of young oysters. When the extremely small oysters hatch from the floating eggs and sink to the

bottom it is important that they find a clean substance for attachment, otherwise they are readily smothered. It is estimated that 4,000,000 bushels of oyster shells are used annually for this purpose, mostly in the waters of New York, Connecticut and Virginia. They are spread immediately before the spawning season, usually in June in the Chesapeake region and in July in Long Island Sound.

Several other varieties of shells are used for "spat collecting," especially "jingles" (*Anomia ophippium*), "quarterdecks" (*Crepidula fornicata*) and scallops (*Pecten irradians*). These are obtained mostly from Peconic Bay at the east end of Long Island where several hundred thousand bushels of mixed shells are dredged annually to be marketed in the oyster planting regions of New York and Connecticut. They are considered superior to oyster shells for "clutch," owing to the fact that they are smaller and only a few young oysters "set" on each, thus avoiding the crowding which occurs when large shells are used. Another reason for their preference is that they are easily broken and disintegrated and so do not encumber the ground after serving as "spat collectors."

Large quantities of shells are used for ornamental purposes. Especially prominent among these are the abalone or ear shells obtained from California, Japan and various other countries. About 500 tons of abalone shells are gathered annually on the Pacific Coast of America, worth about \$40,000. This product, however, is only one-fourth or one-third as large as it was 20 years ago. When cleaned and polished the highly iridescent green, red and pearly white colors are exquisite and make these shells beautifully ornamental. Much skill is exercised in polishing in order to produce the best effects. Some of the abalone shells are of such shape and coloring that it is possible in grinding to produce a perfect cross of black against a pearly white background; these meet with ready sale, the purchasers usually assuming that the cross appeared on the shell in nature.

The large green conch or fountain shell obtained on the Florida coast, the West Indies, etc., is much used for ornament. The graceful curves and the delicate tints of lovely pink color make it one of the most attractive of all shells. It is much used in making brooches, earrings, etc., and in the form of beads in imitation of pink coral and pink pearls. Large quantities of conches have been pulverized and used in porcelain manufacture.

The pectens or scallop shells have long been admired owing to their beauty of form. During the Middle Ages pilgrims ornamented their clothing with them, as an indication, doubtless, of having crossed the sea to the Holy Shrine in Palestine, and for this reason they were known as "pilgrim shells." To commemorate that event they were preserved in the heraldic devices of many families whose ancestors had performed that journey. Scallop shells were formerly much used by cooks for holding foods, hence the name "scalloped oysters."

The popularity of shells for personal ornamentation has resulted in their use as currency or standard of value among many primitive peoples. A well-known example of this is the wampum of the North American aborigines,

made from the quahog or hard clam shell, so numerous on the Atlantic Coast. Somewhat less extensive was the use of the tooth shell or *Dentalium* on the northwest coast, and of the abalone on the California coast. Even at the present time in many parts of Africa and to a less extent in British India species of the cowry family are used as currency. In some seasons eight or 10 vessels carry cargoes of the money cowry (*Cypræa moneta*) to the west coast of Africa, where they are exchanged for palm oil and other products.

The window-glass shell (*Placuna placenta*), found in the Pacific and Indian oceans, and especially among the Philippine Islands, has an almost flat bivalve shell, six or eight inches in length. The inside of this shell is glazed over and has a subdued pearly lustre. It is so thin and transparent that print can be read through it, and it is used as a substitute for glass in windows, admitting a soft, mellow light into the room. It is commonly used in the Philippines in windows of residences, etc.

The giant clam (*Tridacna*) yields the largest and heaviest shells in existence single pairs weighing over 500 pounds in some instances. These are much used for ornaments, especially for fountain basins and for benitiers or holy-water fonts. They are found in many tropical waters, and especially on the pearling grounds, where they are a source of danger to divers. A beautiful pair of these shells are used as benitiers in the church of Saint Sulpice in Paris. This pair is said to have been a gift of the republic of Venice to Francis I.

The most artistic use of shells is in the formation of cameos, which are cut from univalve shells made up of laminæ of different colors. The middle lamina, which is usually white, forms the body of the figure in bas-relief, and the dark inner layer forms the ground. The outer or superficial layer is entirely removed, or it may be used to give a varied appearance to the surface of the design.

Of the several varieties of shells employed in cameo cutting, the black helmet (*Cassis tuberosa*) is the most valuable. This occurs in the West Indies and to a less extent on the American coast south of Cape Hatteras. It has a blackish inner coat and the cameo cut from it shows white upon the onyx ground, varying from dark claret to much lighter shades, producing effective results. This shell is ordinarily 12 inches in length, and usually five brooches of average size and several smaller articles may be cut from each one. The bull's mouth (*C. rufa*) is also popular; it has a red inner coat and a sardonyx ground. The horned helmet (*C. cornuta*) gives white upon an orange yellow background. The laminæ of this shell are apt to separate, making it disagreeable to work. The queen conch is also used to a considerable extent; the ground color is brilliant pink, which is somewhat evanescent on exposure to light. An attractive method of using this shell is to incise the bas-relief in the pink layer, using the white as the background, thus reversing the usual method.

Shell cameo figures consist of copies of antiques, original designs and portraits. Sometimes an entire shell—especially of the black helmet variety—is used, and either a small figure is cut on the face of the shell or the entire surface is covered. In the latter case

the principal design is in the centre and around it are such minor designs as the fancy of the artist dictates. Some of these sell very high, and hundreds and even thousands of dollars are secured for a single carved shell. One exhibited in this country by a Naples artist represented two years' work. See CAMEOS.

SHELL CAMEOS. The ordinary medium used on which to carve cameos (see CAMEOS) was the kinds of quartz having layers of different colors, such as the onyx. They afforded a hard, durable substance which, when carved, maintained the sharpness of line. Shells such as those of the mollusks, conches, etc., were more or less utilized, probably on account of the ease of graving art effects on their softer body, but the ease of manipulation gained was at the cost of their durability. Few specimens of ancient shell cameos come down to us. Most of our earlier examples date from the 15th and 16th centuries. So the question whether ancient shell cameos were few or whether they are scarce now through being discarded when their beauty was marred by age remains open. An artistically carved *Tridacna squamata* shell is in the British Museum, London, claimed to be of Phœnician workmanship (6th or 7th century B.C.).

History.—By the 16th century Italian and French carvers vied with each other in producing artistic cameo effects on shells; there was a good demand for them. These Renaissance pieces are found on such helmet-shaped (*cassis*) conches as the *Cassis rufa* ("bull mouth"), *Cassis tuberosa* ("black helmet"), *Cassis cornuta* ("horned helmet"), also on the *Strombus gigas* ("pink queen's conch") and the *Turbo*. The pearl effect of the nacreous *Meleagrina margaritifera* and even the nautilus shell were utilized; in the former medium is a fine cameo portrait of Napoleon I in the British Museum. The *Cypræa tigris* ("tiger cowrie"), though small was used. The conch shells afforded two layers, white above and, beneath, pink, orange, yellow or gray; some give a reddish or "mahogany" ground. The gray appears to wear longest but most 16th century examples show deterioration. Shell cameos continued to be made in Italy and France till the end of the 17th century, when the demand appears to have died out. Early in the 19th century shell cameos were again in vogue for ladies' brooches and other personal adornment but the fashion fell off largely after the middle of the century only to be revived spasmodically. That the public has continued to appreciate fine effects in spite of reduced pecuniary valuations of mediocre pieces is well evidenced in the fact that so many examples of shell cameos still exist. The hot competition of connoisseurs in acquiring the very finest specimens is emphasized in the instance of the sale dispersing the Marlborough collection in 1899, when a shell Laocoon cameo cut by Fiamingo in the 17th century sold for £335.

Examples.—Some of the finest specimens of shell cameo art to be found in the Morgan Collection donated to the American Museum of Natural History, New York City. Four magnificent examples are given in our illustrations; they are depictions of such subjects as a copy of Guido Reni's 'Aurora' on a Madagascar helmet shell (*Cassis cameo*); the intrusion of Actæon on Diana and her nymphs avenged,

after an Italian conception; Phœbus in his biga (chariot); an engraved nautilus shell displaying legends, prayers and emblems. In the British Museum also are a number of fine specimens of this art. Cyril Davenport, in his work 'Cameos' (London 1900), gives good illustrations of two white and gray cameos depicting respectively "Ganymede and an Eagle" and "Hercules killing Cacus," both of 16th century Italian origin; a "Centaur" cut in *Cypræa* shell of the same date and origin, and a male portrait mounted as a pendant attributed as the others.

Technique.—In the May 1913 issue of the *American Museum Journal*, New York, L. P. Gratacap, curator, gives a clear description of the technique of shell cameo carving. But few of a number of shells are of value for this purpose, those showing dullness, weakness or turbidity or having speckled under surface of the upper layer are rejected. Thinness of the back layer causes the artist to discard such. Having selected a shell, a tin wheel, assisted with water or emery powder, cuts the object into pieces and the best, from the point of view of color and texture, are selected for operation. The design to be carved is chosen according to its adaptation in size and treatment; the thickness of the layers and other qualifications of the specimen point to the degree of boldness of the execution permissible. In the execution of large *chef-d'œuvres* the entire shell surface is sometimes covered with the design. Next the artist prepares the surface by eliminating all imperfections such as discoloration, roughness of surface, etc. The outer edge of the cameo is next produced, in oval, square or oblong form, with the aid of a small grindstone whose lower part revolves in a trough of water (grinding is less liable to split or splinter the tender layers of the shell than sawing). A handle is now cemented to the shell with a mixture of tar, resin and brickdust, wetted paper being used to cover the shell's back. After fixing the handle in the wooden "chancery" of a notched board the shell's surface is cleaned and a drawing of the subject penciled in. In the work of carving 10 graving tools (burins, etc.), of different sizes are used. With the carving finished the background is planished with boxwood burnishers, working in pumice and oil first, then in rotten stone moistened with a little sulphuric acid (oil of vitriol). The polishing deepens the color tones as well as creating a glaze that adds distinction to the relief work. The burnishing process has to be quickly followed by an active cleaning off of the acid with a dampened cotton wad so as to hinder its chemical action from eating into the substance of the shell, thereby creating pittings and unevenness to mar the whole performance. In the more highly talented work a minuteness of detail and almost microscopic expertness are sometimes displayed by the artist that almost equals that to be found in the cameo carvings done in the hard gemstones.

SHELL GAME. See THIMBLE RIG.

SHELL-IBIS, or SHELL or SNAIL EATER, names for the open-bill (q.v.). It is not an ibis, but a stork, and feeds principally

on snails and fresh-water mussels. See OPEN-BILL.

SHELL MONEY. See WAMPUM.

SHELL-SAND. Sand consisting in great part of fragments of shells comminuted by the beating of the waves (see SAND), and often containing a small proportion of organic matter. It is a very useful manure, particularly for clay soils, heavy loams and newly-reclaimed bogs. It is also advantageously applied to any soil deficient in lime. It neutralizes the organic acids which abound in peat, and forms with them compounds which serve as food for plants. Great deposits of shell-sand are found on the coasts of Devonshire and Cornwall, and are of much value in the agriculture of that district. Shell-sand is also found on many other parts of the European coasts, and is much used as a manure in the maritime districts of France, especially Bretagne and Normandy. It abounds upon the coast of Florida and the Gulf of Mexico and in some places has been compacted and cemented into the rocky substance called coquina, and often used as a building-stone.

SHELLABARGER, Samuel, American lawyer and politician: b. Clarke County, Ohio, 10 Dec. 1817; d. Washington, D. C., 6 Aug. 1896. He was graduated from Miami University, Oxford, Ohio, in 1842, and was admitted to the bar in 1847. In 1851 he was elected to the Ohio State legislature, and was a member of Congress in 1861-63, 1865-69, and 1871-73. In 1871 he introduced what was known as the "Ku Klux Law." In 1869-71 he was Minister to Portugal, and after his last term in Congress he was appointed a member of the Civil Service Commission, but devoted himself to the practice of law in Washington. See UNITED STATES — RECONSTRUCTION.

SHELLEY, shēl'ī, Harry Rowe, American organist and composer: b. New Haven, Conn., 8 June 1858. He studied music at Yale under Professor Stoeckel and afterwards Dudley Buck, Vogrich and Dvorák. After completing his musical education in Paris and London, he began his career as professional church organist and since 1899 has been engaged at the Fifth Avenue Baptist Church, New York. He has composed many songs, anthems and organ pieces, and his sustained compositions include two sacred cantatas; a lyric music drama, 'Romeo and Juliet'; a lyrical intermezzo, 'Santa Claus'; a 'Symphony in E major'; 'Leila,' an opera. He is a member of the National Institute of Arts and Letters.

SHELLEY, Mary Wollstonecraft Godwin, English writer: b. London, 30 Aug. 1797; d. there, 21 Feb. 1857. She was the daughter of William Godwin and Mary Wollstonecraft. In 1814 she eloped with the poet Shelley to Switzerland, and after the death of his wife, Harriet Westbrook, was married to him. While traveling with him she composed her famous romance of 'Frankenstein' (1818), which excited an immense sensation. After her husband's death she devoted herself much to literary work, producing 'Valperga' (1823); 'The Last Man' (1826); 'Lodore' (1835); 'Falkner' (1837); and other works of fiction; several biographies for the Cabinet Cyclopædia; 'Journal of a Six Weeks' Tour,' with Shelley (1814); 'Rambles in Germany and Italy' (1844); and

an edition of Shelley's poetical works and miscellaneous writings. (See FRANKENSTEIN). Consult Marshall, Mrs. Julian, 'Life of Mary Wollstonecraft Shelley' (London 1889).

SHELLEY, Percy Bysshe, English poet: b. Field Place, near Horsham, Sussex, 4 Aug. 1792; d. by drowning in the Bay of Spezzia, on or after 8 July 1822. He was the eldest son of Timothy, afterward Sir Timothy, Shelley, a not over-intelligent country gentleman, and grandson of Sir Bysshe Shelley, who was something of an adventurer, handsome, clever and graceless. His mother, Elizabeth Pilford, seems to have handed on to him her beauty and her fondness for writing. After some tutoring he was sent to Sion House Academy, at Brentford, a middle class school, where his shyness and delicacy exposed him to brutal bullying. His biographers seem right in dating from this period his hatred of tyranny and resistance to all forms of oppression. He seems also to have developed his faculty for musing, for scientific speculation and for wide reading, especially at this time in the wild romances of Mrs. Radcliffe and others of her class. On 29 July 1804 he entered Eton where he remained for five years, developing along the lines just described. His tutors were not calculated to inspire his respect and thus could do little or nothing to check his extravagant and abnormal tendencies; nor could the outrageous fagging to which he was subjected fail to be deleterious to so sensitive an organization as his. He was nicknamed "Mad Shelley," lived as much apart as he could, dabbled in chemistry, haunted romantic spots, read widely — acquiring a taste for the classics, — and found some consolation in the society of Dr. James Lind (later represented as the hermit in 'The Revolt of Islam' and as Zonaras in 'Prince Athanase'), an elderly physician of scientific and eccentric tastes, who was apparently more sympathetic than discreet in his relations with a youth in need of guidance. As was natural, the precocious boy soon began writing and before he was 17 had composed a Radcliffian romance, 'Zastrozzi,' as well as some immature poetry — e.g., parts of the 'Wandering Jew' written in conjunction with his cousin and future biographer, Thomas Medwin, who had also been with him at Sion House. Perhaps more important for his future was his interest in serious writers both practical and theoretical, Franklin, Pliny, Condorcet, who strengthened his native bent toward inquiry and were in part responsible for his early abandonment of religious orthodoxy.

Shelley left Eton, with somewhat unexplained abruptness, in the summer of 1809; he matriculated at University College, Oxford, 10 April 1810. From the amount he published in the latter year it would seem that he spent much of the interim in writing, and it is known that he had a love affair with a cousin, Harriet Grove. At Oxford he formed a friendship with the able, rather cynical Thomas Jefferson Hogg, and was encouraged in his wholesale recalcitrancy. The university was little hospitable to advanced ideas, and when Shelley sent to bishops and heads of colleges, copies of his syllabus of arguments demonstrating 'The Necessity of Atheism,' it was small wonder, though a great pity, that, on his failure to answer their questions, the authorities should have handed him a sentence of expulsion al-

ready signed and sealed. (25 March 1811). Hogg protested and was also expelled.

The offending pamphlet was Shelley's sixth publication, and he still lacked several months of being 20. In 1810 he had published — how, is something of a mystery — 'Zastrozzi'; 'Oriental Poetry by Victor and Cazire' (written in conjunction with his sister Elizabeth, withdrawn on the ground that she had borrowed from "Monk" Lewis, long sought for in vain, but finally edited by Dr. Richard Garnett in 1898); 'Posthumous Fragments of Margaret Nicholson' (the mad woman who had tried to kill George III); and 'Saint Irvyne; or, the Rosicrucian,' another Radcliffian romance. It is needless to say that these productions are devoid of intrinsic merit. His fifth publication was 'A Political View of the Existing State of Things,' issued anonymously at Oxford for the benefit of Peter Finerty, a prisoner for libel. This has entirely disappeared.

Shelley left Oxford with mingled regret and indignation and took lodgings in London. His affair with his cousin Harriet Grove had been broken off, and he was soon involved in the most unhappy entanglement of his much entangled life. Not being permitted to come home unless he would break with Hogg and refusing to do this, he found himself adrift in London, and fate brought him in contact with a friend of his sister Elizabeth's, Harriet Westbrook, the pretty daughter of a retired hotel-keeper. She was romantic and fancied herself persecuted by her family; Shelley was also romantic, and persecuted, and quixotic, and inflammable. When he went out of town in July 1811 she wrote him pitiful letters, which so worked upon his feelings that he returned to London, ran away with her and married her at Edinburgh at the end of August. How far the girl's relatives connived at the capture of the baronet's son cannot be ascertained. Naturally the Shelleys were indignant, and cut off the madcap's allowance; but Mr. Westbrook allowed them £200 a year, and finally Shelley's father contributed the same amount.

It is unnecessary to detail their movements at this juncture save to say that they spent some months at Keswick near Southey and then, Shelley being inspired by the theories of William Godwin (q.v.), they went over to Ireland to attempt to redress the wrongs of the long-suffering people. They were accompanied by Harriet's sister, Eliza Westbrook, whose presence grew distasteful to Shelley, and they remained only about two months, since the Irish did not respond enthusiastically to Shelley's pamphlets. He was merely a visionary a little ahead of his times, for Catholic emancipation came peacefully not so many years after his death. When he returned to England, he excited the attention of the government by revolutionary writings, but he was not molested. Believing, however, that an attempt had been made to assassinate him, he returned with his wife and sister-in-law to Ireland, and then he went with Harriet to London, where their first child was born (June 1813). About this time he printed privately his nebulous poem of free-thought 'Queen Mab,' accompanied by notes and a "vindication" of vegetarianism to which he had become a convert. Eight years later a pirated edition brought 'Queen Mab' into notoriety, much to its author's disgust. A dia-

Percy B. Shelley

logue pamphlet, 'A Refutation of Deism' (1814), followed, bringing his publications up to the number of 14. Meanwhile he and Harriet had become estranged, partly no doubt from natural incompatibility, partly from Shelley's instability, to use no stronger term. Critics and readers will probably never agree to the exact distribution of responsibility between the unfortunate pair; but it seems manifest that admiration for Shelley's genius has unduly influenced many of his biographers in their treatment of the matter. He met Mary, the daughter of William and Mary Wollstonecraft Godwin, and, as before with Harriet, found an attractive girl pining for sympathy at a time when he himself stood in need of it. She was a much more congenial partner for him than the inkeeper's daughter, to whom he had just been remarried according to the rites of the Church of England, and after Harriet made the mistake of leaving him and going with her child to her father's at Bath, he lost little time in persuading his new 17-year-old friend to elope with him.

They left England on 28 July 1814 taking with them Jane (Claire) Clairmont, a daughter of Godwin's second wife by a former marriage. They spent some time in Switzerland and then, after some financial difficulties, returned to England in September. Their experiences were later recounted by Mary Shelley in 'The History of a Six Weeks' Tour' (1817). Meanwhile Shelley had made Harriet the astounding proposition that she should live with him and Mary, and after his return to England he saw her and the son she had borne him during their separation. No reconciliation was affected, however, and Shelley naturally found himself cut off from all his former sources of income. The death of his grandfather early in 1815 induced his father to allow him £1,000 a year in order to guard against his encumbering the family estate. He settled £200 a year on Harriet, took a house near Windsor Forest wrote 'Alastor' (1816, a poem still immature in thought, but indicating a great advance in his command of poetic technique), and studied the classics. In May 1816 he went again to Switzerland with Mary and Jane Clairmont, and there he came under Byron's (q.v.) sway, exerting in his turn a strong influence upon his new friend. The autumn found Shelley back in England established at Great Marlow. Here, in December 1816, he learned of Harriet's suicide in the Serpentine. The immediate causes of the act are obscure; but, whether or not the charges that have been made against Harriet's morals during the closing months of her life are fully or partially justified, it seems absurd to acquit Shelley of all responsibility for her tragic fate.

He was now free to marry Mary Godwin (30 Dec. 1816) but the law would not allow him to recover the control of his two children by Harriet. Shelley resented Lord Eldon's decision, with some justice so far as the management of their education was concerned; yet he had certainly so conducted himself as to make the Chancellor's decision seem equitable to most people at the time. Meanwhile a son, William, had been born to him and Mary, Leigh Hunt had become a friend, and Keats an acquaintance, and the elaborate narrative and allegorical poem 'Laon and Cythna' had been

begun. Two political tracts were also published and, true to the humanitarian principles that always actuated his conduct, even when its effects were deleterious to others, Shelley ministered to the sick and needy around him. His charity seemed boundless, and during his visitations he contracted a bad case of ophthalmia. His health had been otherwise poor and, as for many reasons England was not a congenial dwelling-place, he determined to go to Italy. He left England with his family, and by the end of March 1818 was at Turin. Two months previously Ollier had reissued under the title of 'The Revolt of Islam,' the long poem, which on its first appearance, had been entitled 'Laon and Cythna.' The relationship between the hero and heroine had been too close to suit any save the most emancipated readers, and Shelley had reluctantly made a few alterations, in the interest not so much of conventionality and the success of the poem as a plea for the cause of oppressed peoples. No changes could make so long and misty a performance popular; but lovers of poetry will always find 'The Revolt of Islam' incomparable for its glowing pictures and its exquisite melodies. Both in its merits and in its defects it reflects as though it were a mirror, its author's unique, attractive, yet singularly incomplete and unbalanced genius.

The first months in Italy were spent at Lake Como, Milan and the Baths of Lucca, and saw the completion of the romantic poem 'Rosalind and Helen' and the translation of Plato's 'Symposium.' Then Shelley with Jane Clairmont took a disagreeable journey to Venice to see Byron with regard to Miss Clairmont's illegitimate daughter Allegra. (See BYRON). The poem 'Julian and Maddalo' commemorates some features of the visit. Byron loaned Shelley a villa at Este, and the latter at once sent for his family. A few weeks later Mary's second child, Clara, died at Venice. Returning to Este, Shelley began 'Prometheus Unbound' and, charmed by the scenery, wrote the first draft of his beautiful 'Lines Written Among the Euganean Hills.' The winter of 1818-19 was spent at Naples, which inspired, among other things, the 'Lines Written in Dejection,' and a magnificent ode to the beautiful and oppressed city. He also wrote to his friend, Thomas Love Peacock, letters justly famous for their powers of description and admirable prose style. The spring of 1819 found him settled in Rome hard at work upon what is often regarded as his greatest achievement, the aspiring but somewhat nebulous lyrical drama, 'Prometheus Unbound,' published in 1820. Immediately after this he wrote the much more realistic tragedy entitled 'The Cenci,' probably the least subjective of his works, which was composed and published at Leghorn in 1819. Shortly before he left Rome in the summer, his son William sickened and died. The well-nigh heart-broken parents retired to Leghorn and then to Florence, where another son, afterward Sir Percy Florence Shelley, was born. Here in October Shelley wrote that splendid poem, probably the most nobly imaginative of all his lyrics, the 'Ode to the West Wind,' as well as two of his less successful, posthumously published poems, the parody 'Peter Bell the Third' and 'The Masque of Anarchy,' inspired respectively by Wordsworth's famous

poem and by the infamous Manchester Massacre.

The beginning of 1820 saw the wanderers established at Pisa, where Shelley's health began to improve. Several English friends, the Gisbornes and the Williams, and later Lord Byron and the traveler, Trelawny, added to the attractions of the place and stimulated Shelley's genius, if not to the production of any elaborate poems of consequence save 'Adonais' and 'Hellas,' at least to the writing of some of his most beautiful lyrics and charmingly familiar pieces. Among the poems of 1820 were the 'Epistle to Maria Gisborne,' the fantastic 'Witch of Atlas,' the exquisite 'Sensitive Plant,' and those matchless lyrics of their kind, 'The Cloud' and the 'Ode to a Skylark.' The chief productions of 1821 were the Platonic 'Epipsychidion,' the final form of which was inspired by an idealistic passion Shelley conceived for Emilia Viviani, an Italian girl confined in a convent against her will, the delightful and eloquent 'Defence of Poetry' (in prose), the immortal elegy on Keats, 'Adonais' (Pisa 1821), and 'Hellas,' a lyrical drama reflecting the emotions kindled in its liberty-loving author by the Greek revolution. The last-named piece, in some of its choruses at least, gives evidence of such maturing powers that, when we take into account the range of Shelley's interests, mental and emotional, we find it difficult to set limits to his possible achievements if he had been permitted to live and had developed as steadily and as rapidly as he did during the closing years of his short life. It is true that 'Epipsychidion,' despite its marvelous beauty of description and its intensity of spiritual passion, shows that Shelley's idealism was still capable of giving an unwholesome turn to his writings and, to put it mildly, a fatuous twist to his conduct. It is true also that the part Shelley took in luring Leigh Hunt to Italy to start 'The Liberal' (see HUNT, J. H. L., and BYRON) scarcely argues a great increase in worldly wisdom, though it speaks volumes for Shelley's generosity. But, when all deductions are made, the development and the promise of Shelley's 28th, 29th and 30th years are scarcely less remarkable than the development and promise of Keats in the marvelous year of his great odes and 'Lamia.'

In 1822 Shelly began a drama on Charles I, but did his best work on translations from 'Faust' and Calderon's 'Mágico Prodigioso' and on the highly imaginative 'Triumph of Life,' unfortunately left incomplete. In April the Shelleys went with the Williamses to Lerici, and there the friends passed an ideal time until the arrival of the Hunts drew the kind-hearted Shelley early in July to Leghorn and Pisa to look after their comfort. On 8 July he began his return journey with Williams in the yacht *Ariel*, which they owned jointly. Trelawny watched them sail away, saw a squall come up and, when it was over, could catch sight of them no more. His suspicions that all was not well were allayed for a time; but, as the days passed, every one interested in the two voyagers lost hope. On 18 July Shelley's body—if the copies of Sophocles and Keats found in the pockets definitely marked it as his—was washed ashore near Via Reggio. It was first buried in the sand, then cremated—save the heart which would not burn—and the ashes

were buried in the Protestant cemetery at Rome (7 Dec. 1822) under the pyramid of Caius Cestius and near the grave of Keats. There seems to be little reason to credit the notion that the yacht was designedly run down.

Shelley is said to have been tall and slender, very youthful in appearance, with a fair complexion and dark blue eyes full of artless wonder. Trelawny at first sight almost took him for a girl. His receptivity, gentleness, charity and other exquisite traits suggest the woman as did his appearance; but his fiery hatred of oppression and shams, his calm defiance of public obloquy, his power to charm men of the world forbid us to regard him as in any sense effeminate. In his writings no less than in his character and in his appearance this blending of essentially manly and essentially womanly characteristics is perceptible. His ideals were passive rather than active; his most indisputably successful poems are in theme and tone expressions of longing, weakness, pain and sadness; his best descriptive passages are hazy; his verse is fluid and melodious rather than deeply harmonious. On the other hand, he has had the power to inspire strong souls with his ideals; more than any other of our poets he has caught the Greek secret of endowing with life mythical figures and conceptions; he was a scholar, a critic, a man of taste and a prose-writer of no mean order; his genius was varied and copious beyond that of most of his contemporaries. With regard to his final rank in English literature no consensus of opinion seems attainable. While the public indifference that depressed him in his own day has long been overcome, he has never attained true popularity either at home or abroad, and his critics are only too likely to become his worshippers or else to display too openly a feeling of hostility toward his life and works. He is still too much the idol of advanced spirits and of people who are inclined to be a trifle exquisite in their literary tastes and somewhat supercilious with regard to the tastes of others. His position as a great poet is scarcely open to question, but his position as a genuine classic in the fullest sense of the term is surely doubtful so long as Matthew Arnold and other qualified critics dissent from the praise of his ideals, the defense of his conduct, and the enthusiasm for his elaborate poems such as 'Prometheus Unbound' to be encountered in extravagant measure in the books and essays of his admirers. Perhaps it is safe to conclude that, while his conduct must be censured in many particulars, his character must be pronounced singularly winning and lovable, and, that, while his elaborate poems, though wonderful, are not sustained works of art, his genius as a lyrical poet is in range and quality unique and extraordinarily high. See ADONAI; CENCI, THE; ODE TO THE WEST WIND; PROMETHEUS UNBOUND; QUEEN MAB; TO A SKYLARK.

Bibliography.—Various volumes of Shelley's poems, imperfect and in some cases pirated, helped to spread his small reputation until 1839, when Mrs. Shelley published an edition of his works in four volumes. Many important poems and letters have since been published—e. g., in Richard Garnett's 'Relics of Shelley' (1862). The most complete edition of the works in verse and prose is that by H. B. Forman (8 vols., 1876-80). There are good editions of the

poetry—in several volumes—by Forman (the new 'Aldine,' 1892), G. E. Woodberry, and others—also in one volume by Dowden ('Globe'), Woodberry (American 'Cambridge'), and T. Hutchinson ('Oxford,' 1904—the latest and most complete). The prose works were edited by R. H. Shepherd in 1888 (2 vols.). The authoritative biography is that by Edward Dowden (2 vols., 1886)—too plainly the work of an advocate, as J. C. Jeaffreson's 'The Real Shelley' (2 vols., 1885) is the work of a prosecutor. Two good short biographies are those by J. A. Symonds ('English Men of Letters,' 1878) and William Sharp ('Great Writers,' 1887 with a bibliography). Consult also works by F. Rabbe, H. S. Salt, and others and, of course, the earlier lives by Medwin (1847) and Hogg (1858), Trelawny's 'Recollections of Shelley and Byron,' Leigh Hunt's 'Autobiography,' and other books of this devoted friend, etc. Of critical essays there is a large number and variety—see especially those by Matthew Arnold, Walter Bagehot, Dowden, Garnett, Leslie Stephen and Woodberry. For bibliography consult Forman's 'Shelley Library.'

WILLIAM P. TRENT,
Professor of English Literature, Columbia University.

SHELLEY'S CASE, Rule in, a rule declared by the courts of England late in the 16th century. By this rule when an estate of freehold is acquired by gift or purchase by an ancestor, with remainder to his heirs or the heirs of his body, the word "heirs" is a word of limitation and not of purchase; that is, the ancestor takes the estate in fee or in tail, according to circumstances, and the heirs take nothing. The rule has been repealed or amended by statute in most jurisdictions in the United States, so that the heirs take the remainder.

SHELTER ISLAND, N. Y., island and township, Suffolk county; situated at the eastern end of Long Island between Peconic and Gardiner's bays; length, eight miles; width, four. It is connected with the mainland and the Long Island Railroad by ferry to Greenport. The island was originally owned by the Manhasset Indians; was acquired by Lord Sterling, and during colonial times belonged to the jurisdiction of Connecticut. The coast line is irregular and deeply indented with small bays and inlets, affording good harbors for yachts and small craft; there are excellent facilities for pleasure boating and fishing, and the island is a popular summer resort. The New York Yacht Club has a station on the northern coast. Pop. 1,200.

SHELTON, Don Odell, American evangelist and editor: b. Odessa, N. Y., 5 May 1867. He was secretary of the East Side Branch of the Young Men's Christian Association in New York in 1889-99, and in 1906 became president of the National Bible Institute, New York. He founded the *Bible To-day*, and in 1909 became editor of the *Message*. Author of 'Personal Work and the Personal Worker' (1896); 'Public Use of the Bible' (1898); 'Christianize America' (1903); 'Chapters on the Lord's Faithfulness'; 'The Prayer that Changes Things' (1915), etc.

SHELTON, Conn., borough in Fairfield County, on the Housatonic River, 10 miles west of New Haven, and on the New York, New Haven and Hartford Railroad. There are manufactures of pianos, silverware, paper, paper boxes, brass and pins. Pop. 4,807.

SHEM, the eldest son of Noah; according to the Mosaic account, he is the father of all the nations that inhabited southwestern Asia (Gen. x, 21-31), a territory inclusive of Syria Chaldaea, parts of Assyria, of Persia, and of the Arabian peninsula. Hence the inhabitants are called Semites, and their language and civilization styled Semitic. See SEMITIC LANGUAGES, and consult Budde, 'Die biblische Urgeschichte' (Giessen 1883); and the commentaries on Genesis by Skinner (1910) and Ryle (1914).

SHEMAKHA, shě-mā-kā', Russia, town in Transcaucasia, on the Zagolovai, about 63 miles northwest of Baku. It is situated in the midst of mountains, on verdant slopes and was once a commercial centre. It has, however, suffered from earthquakes, and one in 1902 almost destroyed it. Silk manufacture is the chief industry. Shemakha's history from 1712 was one of almost continuous warfare; it was captured and occupied in turn by various Persian, Turkish and Russian commanders. On Ptolemy's map it is set down as Kamachia. Pop. 23,000.

SHEN-SI, shěn-sē, China, a northern interior province, bounded on the north by the Great Wall, which divides it from Mongolia, on the east by Shan-si and Hunan, on the southeast by Hu-peh, on the south by Sze-chuen, and on the west by Kan-su; area, 75,270 square miles. It is traversed by the Pehling range, separating the basins of the Hwang-ho and Yang-tse or Yellow and Great rivers; is well watered, chiefly by the Wei-ho, Loh and Wu-ting; produces good crops of wheat, millet, and cotton, maize, rape seed, opium, hemp, and tobacco, rears great numbers of horses, cattle, goats and sheep; and has mines of iron, copper, lead, coal and gold. These, with rhubarb, musk and wax, are the chief exports. The capital of the province is Sing an fu. Pop. 8,450,200.

SHENANDOAH, shěn-an-dō'a, Iowa, city in Page County, on Nishnabotna River, 110 miles southwest of Des Moines, on the Chicago, Burlington and Quincy, the Wabash, and the Keokuk and Western railroads. The Western Normal College is located here as is the World's Missionary Training School. There are seed firms, nurseries, packing industries, and manufactures of wagons, plows, brick, tile, knit goods, flour and cigars. Pop. 4,976.

SHENANDOAH, Pa., borough in Schuylkill County; on the Pennsylvania, the Philadelphia and Reading, and the Lehigh Valley railroads; about 100 miles northwest of Philadelphia and 12 miles north by east of Pottsville, the county-seat. The place was settled about 1850 by William Kelley, but was not laid out as a city until 1862; in 1866 it was incorporated as a borough. It is the commercial and industrial centre of a region rich in anthracite coal; six large collieries are within the limits of the borough, and a number of other large collieries are within a one-mile radius. The chief industries of the place are connected with the

mining and shipping of coal; machine shops, mining-tool works and foundries are among the manufactories. Other manufacturing establishments are hat and cap factories, brewery and printing establishments. There are several churches, representing the different denominations, public schools, parish schools and a public library. There are also national banks, savings bank and building and loan associations. The government is administered by a chief burgess and a council of 15 members chosen at popular election. Pop. 28,649.

SHENANDOAH, a river in Virginia which has its source in Augusta County, and flows northeast, on the west side of and nearly parallel to the Blue Ridge. It enters the Potomac at Harper's Ferry, W. Va. Its total length is about 170 miles. It flows rapidly over nearly all its course and furnishes extensive water power which is used for manufacturing and has contributed greatly toward the industrial prosperity of the valley. The valley of the Shenandoah was the scene of many stirring engagements of the Civil War.

SHENANDOAH, *The*, a ship named after the Shenandoah River, Virginia, bought by the Confederate States during the American War of the Confederacy and placed in commission as a privateer during the last year of that war. The *Shenandoah* was built in Glasgow in 1863; she was intended for the far Eastern trade but was purchased by the Confederates in 1864 and in October of that year was commissioned as a privateer. The ship, named the *Sea King*, had sailed from London for Madeira, where she received her privateersman's crew, composed mostly of officers from the *Sumter*, the *Alabama*, then destroyed, and the *Georgia*, and common sailors, under the command of Capt. James I. Waddell. The *Shenandoah* sailed from Madeira and circumnavigated the globe, via Melbourne, being the only Confederate vessel to do so. In the course of her career she captured or destroyed 39 of the enemy's vessels, valued in the aggregate at about \$2,000,000. Her last action, the last hostility of the war, was on 28 June 1865, about three months after the war had ended, when the *Shenandoah* appeared among the American whalers near the Bering Straits and captured 10 vessels before nightfall. On 2 August Captain Waddell learned from an English bark of Lee's surrender, five months before. He sailed at once to Liverpool and delivered his ship to the British man-of-war *Donegal*, never having been captured nor defeated in his entire career. The British government released all of the crew not British-born and turned the vessel over to the American consul.

SHENANDOAH MOUNTAINS, a range in Virginia, belonging to the Alleghanies, extending northeast and southwest, and forming the western boundary of the Shenandoah Valley.

SHENANDOAH VALLEY, Va., between the Shenandoah Mountains on the west and the Blue Ridge Mountains on the east. It is noted for its beautiful scenery and the variety and beauty of its vegetation. The large forests found here contain chestnut, hickory, oak and other hardwood trees. The valley acquired a world-wide fame during the Civil War, when

it was the scene of many encounters. In 1862 took place here the campaign of "Stonewall" Jackson (q.v.), and in 1864 it was the scene of the campaigning of Philip Henry Sheridan (q.v.).

SHENANDOAH VALLEY, *Military Operations in*. At the beginning of the Civil War the Shenandoah Valley was the garden spot of Virginia, full of grain and hay and teeming with livestock and other supplies essential to the Confederates. It became the beaten track and alternately the camping-ground of both armies, witnessed much brilliant strategy and many hard-fought battles, and at the close of the war was a scene of desolation. Its topography favored the Confederates, since, as covered on the east by the Blue Ridge, it was the easiest route for threatening Washington and the most direct route for their armies to move into Maryland and Pennsylvania.

1861.—Virginia passed an ordinance of secession on 17 April, and the next night State troops moving, without authority of the governor, from Staunton and other points in the valley, seized Harper's Ferry, with its arsenal, armory and munitions of war, the small United States guard abandoning the place and retreating to Carlisle, Pa. The town was speedily occupied by several Virginia regiments, and Col. T. J. Jackson put in command. Jackson was relieved by Gen. J. E. Johnston, 23 May. Upon the dash of Col. Lew Wallace on Romney (q.v.), 13 June, and the approach of Gen. R. Patterson from Chambersburg to Williamsport, threatening his position, Johnston, 15 June, burned all the bridges of the Potomac from Harper's Ferry northward to Williamsport, abandoned Harper's Ferry and fell back to Winchester. On 2 July Patterson crossed the Potomac at Williamsport, occupied Martinsburg and, under General Scott's order, threatened Johnston at Winchester, to hold him there, while General McDowell advanced on General Beauregard at Bull Run; but, 18 July, Johnston eluded Patterson and with 9,000 men marched through Ashby's Gap to Piedmont and took cars for Manassas. The Union occupation of the lower valley was brief; Patterson, after Johnston had left the front, fell back to Harper's Ferry, where 25 July he was relieved by General Banks, when the Union troops, save a small guard at Harper's Ferry, were withdrawn to the Maryland side of the Potomac. Late in October "Stonewall" Jackson was assigned to the command of the Confederate forces in the lower valley, with headquarters at Winchester, and was reinforced by Loring's division from West Virginia. Jackson swept the few Union outposts from the fringes of the valley, broke the Baltimore and Ohio Railroad and Chesapeake and Ohio Canal in several places, as far westward as Hancock, and 10 Jan. 1862 drove the Union forces from Romney and occupied it with Loring's division. By order of the Confederate Secretary of War, 31 January, Loring was withdrawn from Romney to Winchester, where Jackson remained during the rest of the winter, the Union forces again occupying Romney on 7 Feb. 1862, demonstrating on Winchester and sending expeditions southward to bring in cattle.

1862.—Active operations began in the valley late in February by the movement of two Union

divisions across the Potomac at Harper's Ferry and an advance on Winchester, near which Lander's division from Romney and the south branch of the Potomac joined the column. Manassas and Centreville were evacuated by Johnston on 8 and 9 March, and Jackson, with his 5,000 men, under Johnston's order, abandoned Winchester on the night of the 11th, as he was on the eve of giving battle to General Banks, and fell back up the valley 42 miles to Mount Jackson, followed by Shields' (formerly Lander's) division of Banks' corps. On the 20th Shields moved back to Winchester, followed by Jackson. Informed on the march that part of Banks' corps was being sent from the valley to reinforce McClellan east of the Blue Ridge, Jackson, in order to detain it in the valley, pressed Shields closely, skirmished with him on the evening of the 22d, and next day brought him to battle at Kernstown (q.v.), less than four miles south of Winchester, and being defeated, again retreated up the valley. His action had the desired effect; Williams' division, which was on the march through Snicker's Gap of the Blue Ridge, was recalled and Banks again pursued Jackson up the valley as far as Harrisonburg, 66 miles from Winchester. Jackson fell back to Swift Run Gap, in the Blue Ridge, on the road from Harrisonburg to Gordonsville, where he watched an opportunity to strike Banks in flank and rear should he advance from Harrisonburg to Staunton. Under President Lincoln's order Banks fell back to Strasburg, and Frémont, commanding a corps, was ordered to move from Franklin and Monterey to co-operate with Banks in an advance on Staunton. Jackson, informed of Frémont's advance, made a rapid movement from Swift Run Gap to Staunton and, pushing through that place on 5 May, engaged Frémont's advance, under Generals Schenck and Milroy, on the 8th, and in a hard-fought battle checked it, Schenck falling back to Franklin. (See McDOWELL, IRVIN). Jackson followed to Franklin, found Schenck too strongly posted to attack and on the 12th began his return march to the valley to attack Banks. On the 19th he started from Mount Solon, near Harrisonburg, on the 21st crossed the Massanutten Mountains from New Market to Luray, and, joined by Ewell's division, swept down the Luray Valley, with over 16,000 men and 48 guns, defeated Colonel Kenly's command of 900 men at Front Royal (q.v.), 23 May, and pursuing, captured the most of it. This movement turned Banks' fortified position at Strasburg, and on the morning of the 24th Banks retreated northward on the valley pike, was struck in flank by Jackson at Middletown and Newtown, but foiled his efforts to intercept him, and after a running fight from Middletown to Winchester, halted on the night of the 24th at Winchester to give battle. On the morning of the 25th Jackson attacked Banks, who had about 7,000 men, defeated him and drove him across the Potomac at Williamsport. (See WINCHESTER, BATTLE OF). Jackson halted his main body a few miles beyond Winchester, but the cavalry followed Banks to the river. On the 28th Jackson sent part of his force toward Harper's Ferry, which made a demonstration, as though intending to force the position and cross into Maryland. Meanwhile Frémont and McDowell, moving respectively from Franklin on the west

and Fredericksburg on the east, were converging on Strasburg, in Jackson's rear, to cut him off, upon which he abandoned his demonstration on Harper's Ferry and, starting from Winchester early in the morning of the 31st, by a rapid march slipped through the net prepared for him and arrived at Strasburg 1 June, Frémont's skirmishers being within a mile of the road over which he passed. Next day Frémont gave a stern chase on the valley pike, and Shields' division, now of McDowell's corps, marching by Luray Valley, endeavored to reach Jackson's rear or strike him in flank. Frémont pressed his rear closely in many sharp encounters, driving him steadily through Woodstock, Edenburg and Mount Jackson; but Jackson, avoiding a general engagement, when arriving at Harrisonburg, sent his sick and wounded to Staunton, and 6 June, turning to the left, marched toward Port Republic. Later in the day his rear guard had an encounter with Frémont's advance near Harrisonburg (q.v.), in which Gen. Turner Ashby, a gallant Confederate cavalry commander, was killed, and the result of which was that Frémont's advance was repulsed. Frémont advanced in force from Harrisonburg on the morning of the 8th, and at Cross Keys (q.v.) was met by Jackson, who, after a severe fight, repulsed him. Leaving Ewell's division to resist Frémont, should he renew the fight next morning, Jackson marched the rest of his army to Port Republic to meet Shields, who was moving up Luray Valley, and whose advance, under Colonel Carroll, had dashed into Port Republic on the morning of the 8th, was driven out and joined later in the day by a brigade under Col. E. B. Tyler. Jackson attacked the two brigades of Tyler on the morning of the 9th, and at first was repulsed, but finally, on being reinforced, after a hard fight, drove Tyler from the field and back into Conrad's Store, on the other two brigades of Shields' division. (See PORT REPUBLIC, BATTLE OF). Ewell had been recalled from Frémont's front, the bridge over the South Branch destroyed, thus checking Frémont's pursuit, and that night Jackson marched to Brown's Gap in the Blue Ridge. Frémont and Shields were ordered to cease pursuit and fall back, the former to Middletown to join Sigel and Banks, who had advanced from Harper's Ferry and Williamsport, the latter to join his corps at Fredericksburg. The Valley campaign of 1862 established Jackson's fame as a soldier. From the date of his arrival at Staunton, 5 May, to the battle of Port Republic was 35 days, during which he had marched about 300 miles, fighting four battles and engaging in many other encounters, and with 16,000 men had kept 60,000 Union troops employed, and paralyzed McClellan's campaign against Richmond. On 17 June Jackson stole quietly away from Brown's Gap to join Lee on the Chickahominy. Munford's cavalry brigade and a few infantry were left in the valley to demonstrate in the direction of Strasburg, and Munford was soon relieved by Robertson's brigade, which took post at Harrisonburg and New Market. When General Pope, 27 June, took command of the Army of Virginia, formed by the corps of Frémont, Banks and McDowell, he withdrew Frémont and Banks from the valley to the east of the Blue Ridge, leaving garrisons of a small brigade each at Winchester, Martinsburg and Harper's Ferry

to cover the Baltimore and Ohio Railroad. Throughout July and August 1862 the valley enjoyed comparative quiet. In August Lee advanced upon Pope and drove him back to the defenses of Washington, then crossed the Potomac into Maryland by a route east of the Blue Ridge. Upon arriving at Frederick and finding, contrary to his expectations, that Martinsburg, Winchester and Harper's Ferry were still held by Union troops, interposing on his proposed line of supply through the Shenandoah Valley and interfering with his intended movement into Pennsylvania, Lee on 10 September sent Jackson across the Potomac at Williamsport to clear the valley of Union troops and capture those at Harper's Ferry. Winchester had already been abandoned; General White was driven from Martinsburg to Harper's Ferry on the 11th, and on the morning of the 15th Harper's Ferry surrendered and the entire valley was once more in Confederate possession. When Lee withdrew across the Potomac, after the battle of Antietam, he halted a month on the Opequon and near Winchester; but when McClellan began crossing the Potomac at Berlin, on 25 October, and moved along the east foot of the Blue Ridge, Lee set his troops in motion up the valley, contesting with McClellan possession of the passes leading into the valley, and marching Longstreet's corps through Chester Gap to Culpeper Court House, left Jackson's corps in the valley, near Winchester, with one division at Chester Gap. McClellan was relieved from command of the Army of the Potomac 7 November, and Burnside, who succeeded him, marched from Fredericksburg, and when his advance appeared before that place on the 17th, Jackson withdrew from the valley by way of Swift Run Gap, and joined Lee at Fredericksburg, leaving in the valley a strong brigade of cavalry, supported by a small force of infantry. Union forces now crossed the Potomac and the Confederates were pushed up the valley to New Market, and again the Union troops occupied the lower valley, holding Winchester, Martinsburg and Romney, with outposts at Strasburg, and scouting up the valley of the South branch as far as Monterey. Under cover of this occupation the Baltimore and Ohio Railroad was repaired.

1863.—Active operations in the valley began this year by a Confederate raid from near Staunton to destroy the Baltimore and Ohio Railroad west of New Creek, which resulted in several encounters, and was partially successful, many bridges being burned and the road broken in places as far westward as Clarksburg, W. Va. While these movements were in progress Lee defeated Hooker at Chancellorsville, after which he immediately began preparations for his second invasion of Maryland which culminated in the battle of Gettysburg, and chose the route through the Shenandoah Valley, which offered a safe line of operations, and was held by Union troops not sufficient in number to present a serious obstacle. General Milroy, with about 9,000 men, occupied Winchester, with a brigade in observation at Berryville; General Kelley, with 10,000 men, was at Harper's Ferry; and a detachment of 1,200 men and a battery under Colonel B. F. Smith, at Martinsburg. There were outposts at Romney and also toward Strasburg and Front Royal watching the Confederate cavalry and

infantry under General Jenkins in the upper valley. Lee began his movement 7 June by ordering General Imboden, then near Monterey, to move on Romney, by way of the South branch of the Potomac, and directing Jenkins, with his brigade of cavalry, to march down the valley and concentrate at Strasburg or Front Royal, to co-operate with the advance of the army. Ewell's corps, leaving Brandy Station on 10 June, passed through Chester Gap and, marching by way of Front Royal arrived at Cedarville on the evening of the 12th, where Ewell detached Jenkins' cavalry brigade and Rhodes' division of infantry to capture MacReynolds' brigade at Berryville; but MacReynolds, discovering their approach, withdrew to Winchester, which he reached by a roundabout way, on the 13th. Rhodes and Jenkins, avoiding Winchester, pushed on to Martinsburg and, on the 14th, drove Smith and his battery from the place, capturing five guns of the battery that were retiring on the Williamsport road. Smith and his infantry escaped by crossing the Potomac at Shepherdstown Ford and moving to Maryland Heights. Meanwhile Ewell, with the two divisions of Early and Edward Johnson, marched direct on Winchester, surrounded and captured most of Milroy's command on the 15th; after a hard fight, part of those who escaped reached Harper's Ferry and part crossed the Potomac at Hancock. (See WINCHESTER, MILITARY OPERATIONS AT AND NEAR). On the 15th Early crossed the Potomac at Williamsport and Shepherdstown Ford, and occupied Hagerstown and Sharpsburg. On the 17th the garrison at Harper's Ferry was withdrawn to Maryland Heights. Imboden had driven the Union troops from Romney and collected a large herd of cattle, and once more the Valley of the Shenandoah was cleared of Union troops. Lee reported that as the result of these operations Ewell had captured 4,000 prisoners, with their arms, 28 guns, 11 colors, 300 loaded wagons, with their teams and a considerable quantity of stores of all descriptions. After Gettysburg, Lee recrossed the Potomac at Williamsport on the night of 13 July and marched to Winchester and Bunker Hill. When Meade crossed the Potomac south of Harper's Ferry, Longstreet's corps moved up the valley, crossed the Blue Ridge at Chester Gap and marched to Culpeper Court House, where it arrived on the 24th. A. P. Hill's corps followed by the same route, and Ewell's after pursuing Kelley's Union troops west of Martinsburg, found Chester Gap and Manassas Gap held by Meade, who was marching along the east side of the Blue Ridge, and crossing higher up, at Thornton's Gap, joined the army at Culpeper. (See MANASSAS GAP, ENGAGEMENT AT). Again the lower valley was reoccupied by Union troops, and remained in their possession at the opening of the campaign of 1864. Late in the year General Early was put in command of two infantry brigades and some cavalry to hold the upper valley, annoy the Union forces at Winchester, to collect and bring away everything useful to the Union troops or his own, and especially to buy or seize cattle, horses, sheep and hogs, in which the lower valley and that of the South branch abounded. His instructions to do this were carried out to the letter, and the winter of 1863-64 witnessed a most remarkable for-

aging campaign, in which the lower valley and that of the South branch were stripped of thousands of animals. These foraging parties brought on many collisions between the opposing troops.

1864.—In the general movement planned by Grant for the armies under his command in May 1864, General Sigel, who had command in the Shenandoah Valley, was to advance from Harper's Ferry and Winchester up the valley, seize the rich stores of grain, and form a junction with General Crook, who, with cavalry, infantry and artillery was to march from the mouth of Gauley River, West Virginia, to destroy the Virginia and Tennessee Railroad and reinforce Sigel at Staunton, for a movement on Lynchburg. Sigel had about 24,000 men in his command, most of them guarding the railroad from the Monocacy and Harper's Ferry to Parkersburg and Wheeling. He concentrated part of them at Winchester, ordered his cavalry to Cedar Creek and Strasburg and, starting from Winchester 9 May, with 5,500 infantry and artillery, 1,000 cavalry and 28 guns, moved up the Valley. His cavalry had several mishaps and was badly punished and, after a severe defeat of his command by General Breckinridge at New Market, 15 May, he retreated to Cedar Creek. General Hunter relieved him on the 21st and, being reinforced to 8,500 men, advanced upon Gen. W. E. Jones at Piedmont, defeated him there 5 June, and next day occupied Staunton. (See *PIEDMONT, BATTLE OF*). At Staunton, Hunter was joined by Crook and Averell; he began the work of destruction, thoroughly and quickly completed it, and on the 7th marched on Lynchburg, which he failed to take. He was driven westward by Early, who, with his corps of 8,000 men, had been sent by Lee, 12 June, from Gaines' Mill to expel Hunter from the valley and, if possible, destroy him, and then to threaten Washington. It may here be stated that Hunter, Crook and Averell marched to the Kanawha, and thus left the valley open to Early. On 23 June Early began his return march from the pursuit of Hunter, and reached Staunton on the 27th. He had been joined by Breckinridge's division of infantry, and McCausland's brigade of cavalry. On the 29th he sent the greater part of his cavalry to destroy the bridges of the Baltimore and Ohio Railroad, and with his main body pushed down the valley turnpike, reaching Winchester 2 July. After driving all the Union troops from the lower valley and destroying as much as possible of the railroad and canal, he crossed the Potomac at Shepherdstown, demonstrated on Maryland Heights (q.v.), and marching through Frederick, defeated Gen. Lew Wallace at Monocacy (q.v.) 9 July, and then marched on Washington. Failing to take Washington by surprise, as he had hoped to do, he retraced his steps, recrossed the Potomac at White's Ford on the 14th, and resting two days near Leesburg, moved on the morning of the 16th for the Shenandoah Valley by way of Snicker's Gap in the Blue Ridge; crossed the Shenandoah River at Snicker's Ferry, and on the 17th took up a position near Berryville. Meanwhile Hunter and Crook, who had retreated from Lynchburg to the Kanawha, had come by steamboat and railroad and joined the forces at Harper's Ferry, and on the 18th and 19th

engaged Early at Snicker's Ferry and Berry's Ferry without success. During the 19th Early learnt that Averell's division of cavalry, which also had come from the west, was marching from Martinsburg toward Winchester, threatening his rear, whereupon, during the night, he began a retreat to Strasburg. Averell defeated Ramseur's division at Stephenson's Depot on the 20th, which caused Early to move back with one division from Newtown to Winchester; but being threatened by the Union advance from Berryville, he again fell back to Newtown, and on the 21st concentrated his infantry near Middletown. Next day he fell back beyond Cedar Creek and covered all the roads from Winchester. Crook and Averell united their forces at Kernstown, and on the morning of the 24th Early again moved on Winchester, attacked Crook and drove him back, pursuing beyond Winchester. (See *KERNSTOWN, SECOND BATTLE OF*). Early continued the pursuit next day to Bunker Hill, Crook and Averell recrossing the Potomac. On the 26th Early marched to Martinsburg (q.v.), and devoted the 27th and 28th to the destruction of the railroad; and on the 29th McCausland crossed the Potomac on his noted raid to Chambersburg, Pa. (q.v.). Early remained at Martinsburg and Bunker Hill until 3 August, sending expeditions into Maryland by Williamsport and Shepherdstown fords to Hagerstown and Sharpsburg, collecting horses, cattle and other supplies, then, recrossing the Potomac on the 6th, concentrated at Bunker Hill on the 7th.

Grant had been annoyed and disturbed by these Confederate irruptions and operations in the valley, and had come to the decision that it should be made untenable for either army and had framed instructions for Hunter to drive the Confederates from it and make it a waste, where no army could live. Hunter yielded the command to Sheridan, who took it 7 August and proceeded to carry out Grant's instructions. On the morning of the 10th Sheridan marched his army from Halltown, near Harper's Ferry, toward Early's line of communication, upon which Early abandoned Winchester on the 11th and fell back to Cedar Creek, followed by Sheridan next day. At Cedar Creek Early received reinforcements—a division of infantry, two brigades of cavalry, and a battalion of artillery from Lee's army, all under command of Gen. R. H. Anderson—and resumed the offensive so aggressively with his cavalry, bringing on several sharp encounters, that Sheridan withdrew his infantry on the night of the 16th, his cavalry following next day, driving all the livestock in that part of the valley before it, and burning the grain from Cedar Creek to Berryville, near which Sheridan had taken position. Early pursued Sheridan on the morning of the 17th, struck and routed part of his command near Winchester, drove it through the town, and on the 21st moved with his whole army to attack Sheridan at Berryville. That night Sheridan, after some sharp encounters with Early's advance, fell back to Halltown. For three days Early demonstrated on Sheridan's position, then, leaving one division in front of Sheridan, marched on the 25th, with four divisions and his cavalry, to Lee Town and toward Shepherdstown, his cavalry pushing on to Williamsport. Beyond Lee Town, Early met and engaged Torbert's cavalry

and drove it back to Shepherdstown. (See SHEPHERDSTOWN, ENGAGEMENTS AT). Early remained that night at Shepherdstown, where he was joined next day by his cavalry, which had demonstrated on Williamsport, and the command returned to Winchester. On 28 August Sheridan advanced his infantry to Charlestown. Merritt's cavalry division, going by way of Lee Town, drove the Confederate cavalry from that place to Smithfield and across the Opequon. Next day Early drove Merritt back through Smithfield, but was checked and driven back himself across the Opequon by a division of Sheridan's infantry. (See SMITHFIELD, ENGAGEMENT AT AND NEAR). There were now several minor encounters and counter demonstrations, and on the morning of 19 September Sheridan crossed the Opequon and in a hard-fought battle defeated Early, who retreated to Newtown and Fisher's Hill, near Strasburg. (See OPEQUON, BATTLE OF THE). Sheridan followed on the 20th, and on the 21st again defeated Early at Fisher's Hill (q.v.), pursuing his retreating troops during the night and next day to Mount Jackson. Beyond New Market, Early abandoned the valley pike and took a road leading to Port Republic. Sheridan, not having his cavalry with him, halted until it came up on the 25th, when it advanced to Staunton and Waynesborough, destroying the railroad between the two places, but, being threatened in flank and rear by Early, fell back, burning mills, storehouses, barns, grain and forage, driving before them all livestock and devastating the whole width of the valley from Staunton northward. On the return march Sheridan's cavalry was harassed by that of the Confederates, who were turned upon and routed at Tom's Brook, 9 October, when Sheridan resumed his march down the valley, halting on the 10th on the north side of Cedar Creek. Early had followed, and on the morning of 19 October fell upon Sheridan's army and drove it back in some disorder, but it was rallied near Middletown and, resuming the offensive, defeated Early, who retreated to New Market. (See CEDAR CREEK, BATTLE OF). This practically ended the valley campaign of 1864. There were numerous raids and cavalry encounters, but no general movements or heavy engagements. Early remained in the vicinity of New Market until 16 December, when he fell back to near Staunton, and Sheridan went into winter quarters at Kernstown. Between the two there was no subsistence for man or beast; the valley had been desolated. One of Early's staff records in his diary that from the time of Early's appearance in the valley late in June till the middle of November he had marched 1,670 miles and had 75 battles and skirmishes.

1865.—During the winter the greater part of Early's command was sent to Lee at Petersburg, leaving Early a very small force of infantry and cavalry. On 27 February Sheridan, with two well-equipped divisions of cavalry of 5,000 men each, started from Winchester on the last campaign up the Shenandoah Valley, and with but little opposition reached Staunton, Early falling back to Waynesborough. The work of destruction at Staunton was completed, and Early was followed to Waynesborough, where 2 March his command of 1,800 men was defeated and dispersed, most of them being

captured, with all their colors, 11 guns and train. (See WAYNESBORO, BATTLE OF). Sheridan then moved unmolested to the Virginia Central Railroad, which he destroyed for miles, and marched to White House, on the Pamunkey River, where he arrived 19 March, and then moved to join Grant's army before Petersburg.

There is no area upon which the armies contended that witnessed more brilliant strategy, fertility of resource, more rapid and exhausting marches, and more gallant fighting than that enclosed by the Alleghany Mountains and the Blue Ridge; there was no other section of the country whose inhabitants suffered more than did those of the Shenandoah Valley. Consult 'Official Records,' Vols. II, V, XI, XII, XIX, XXI, XXV, XXVII, XXIX, XXXVII, XLII, XLIII, XLVI, LI; Allan, 'Jackson's Valley Campaign'; Ashby, T. SHENG-KING, shēn-kīng', or **LIAO TUNG**, lyō-toong', Manchuria, the southernmost province, stretching into the Yellow Sea between the gulf of Liao Tung and Korea Bay, has an area of 55,000 square miles, a pleasant climate, and is generally fertile. Pop. 5,500,000. The southern portion of the province is known as the Liao Tung Peninsula; at the extremity is Port Arthur (q.v.) taken by Japan in the war of 1894-95, but retroceded to China on the payment of 30,000,000 taels (\$21,300,000). In 1898, however, the Chinese leased it and adjacent territory including Talienwan or Dalny, to Russia. Consequent on the Boxer troubles of 1901 Russia occupied the whole of Manchuria, and rapidly proceeded to colonize it. This procedure was interrupted by the Russo-Japanese war of 1904. See MANCHURIA.

SHENSHIN, Afanasy Afanasevich. See FET, AFANASY AFANASEVICH.

SHENSTONE, William, English poet and landscape-gardener: b. Halesowen, then Shropshire, now Worcestershire, November 1714; d. there, 11 Feb. 1763. He was educated at Oxford, and intended entering a profession, but after inheriting his father's estate, Leasowes, lived in retirement upon it, devoting his life to its embellishment and to writing poetry, much of which was very popular, though little of it is now remembered. Among his poems are 'The Schoolmistress' (1742); 'Pastoral Ballad' (1743); and the stanzas 'Written in an Inn.' His complete works were published in three volumes by Robert Dodsley (1764-69), and an edition of his poems with a memoir by Gilfillan appeared at Edinburgh in 1854. Consult Beers, H. A., 'History of English Romanticism in the Eighteenth Century' (New York 1899).

SHEOL, shē'ōl, a Hebrew word signifying the place of the dead. Wherever it occurs in

the Hebrew text it is rendered in the authorized English version by "grave" or by "hell," or by "pit." In the revised version "Sheol" is generally left untranslated in the text, while "grave" is put in the margin. (See *HADES*; *HELL*). Consult Jastrow, M. (in *American Journal of Semitic Languages*, Vol. XIV, Chicago 1898); Jensen 'Die Kosmologie der Babylonier' (Strassburg 1890); Schroder, 'Die Keilinschriften und der alte Testament' (Berlin 1902).

SHEPARD, Charles Upham, American mineralogist: b. Little Compton, R. I., 29 June 1804; d. Charleston, S. C., 1 May 1886. He was graduated from Amherst in 1824 and made a special study of botany and mineralogy in the following year. He was lecturer on natural history at Yale in 1830-47, occupied the chair of chemistry at the Medical College of South Carolina in 1854-61 and resumed it a few years after the Civil War. He was professor of chemistry and natural history at Amherst in 1845-52, and from 1852-77 was lecturer on natural history, after which he was made professor emeritus. His investigations resulted in the discovery of a new species of microlite in 1835, of warwickite in 1838, and of danburite in 1839, and he was also the discoverer of valuable deposits of phosphate of lime near Charleston which have proved of great value to agriculture, and their use in the manufacture of superphosphate fertilizers has made an important addition to the chemical industries of South Carolina. His collection of minerals was at one time the best in the country, but was unfortunately partially destroyed by fire three years after its purchase by Amherst in 1877. In addition to his numerous scientific papers his publications include 'Report on the Geological Survey of Connecticut' (1837); 'Treatise on Mineralogy' (1855), etc.

SHEPARD, Edward Morse, American lawyer: b. New York, 1850; d. 28 July 1911. He was graduated from the College of the City of New York in 1869, studied law and was admitted to the bar. He established a practice in Brooklyn, and was an active member of the Democratic party there, being one of the organizers of the Young Men's Democratic Club of Brooklyn. He held no public office except as member of the civil service commission of the city in 1883-85, and chairman of that commission in 1888-90. In 1884-85 he was a State forestry commissioner, and was the author of the commission's report for that year. In 1901 he was the regular Democratic nominee for mayor of Greater New York, but was defeated by Seth Low. For several years he was counsel for the New York Rapid Transit Commission, and resigned that position in March 1904 to become general counsel for the Pennsylvania Railroad. He wrote 'Martin Van Buren' (in *American Statesmen Series*; rev. ed., 1900); 'Dishonor in American Public Life' (1882); 'The Work of a Social Teacher' (1884).

SHEPARD, Helen Miller (GOULD), American philanthropist: b. New York, 20 June 1868. She is a daughter of the late Jay Gould (q.v.), and has achieved an extended fame through her benefactions for charitable and educational uses. At the opening of the war with Spain she not only contributed \$100,000 to the United

States government, but was active in the Woman's National War Relief Association, to which she was a generous contributor. Among other notable gifts of hers are the library of New York University; \$50,000 to the naval branch of the Young Men's Christian Association of Brooklyn; and \$100,000 to New York University, for a Hall of Fame for Great Americans, in 1900. She married Finley Johnson Shepard 22 Jan. 1913; is a member of the board of the Russell Sage Foundation and of the national board Y. W. C. A.

SHEPARD, Thomas, English Puritan divine: b. Towcester Northamptonshire, 5 Nov. 1604; d. Boston, Mass., 25 Aug. 1649. He was graduated at Emmanuel College, Cambridge, in 1623, and after taking his A.M. there in 1627 he became a preacher at Earles-Colne. His practices, however, displeased Bishop Laud and he was forbidden to preach within the diocese of London. He was later chaplain to Sir Richard Darly in Yorkshire, and afterward was called to the ministry at Heddon Northumberland. Through his non-conformity he was again silenced, this time by Archbishop Neile. He went to Boston in 1635, and was ordained pastor at Newton, now Cambridge. He was active in founding Harvard College and secured its location at Cambridge. He was also instrumental in establishing an Indian Mission. His religious writings attained a considerable reputation. Author of 'The Sincere Convert' (1641); 'The Sound Believer' (1645); 'Theses Sabbaticæ' (1649), etc.

SHEPARD, William, American soldier: b. Boston, Mass., 1 Dec. 1737; d. Westfield, Mass., 11 Nov. 1817. He enlisted in the provincial army at the outbreak of the French and Indian War and served until 1763, participating in the battles of Fort William Henry and Crown Point and attaining rank as captain. He entered the Continental service at the beginning of the American Revolution, became colonel in 1777 and served until the close of the war. He was engaged in 22 battles and won a high reputation for his courage and ability. In 1788-90 he was a member of the executive council and as brigadier-general in command of the militia he defended the arsenal in Springfield at the time of Shays' Rebellion in 1786. He was afterward promoted major-general of militia and in 1797-1803 served as member of Congress.

SHEPHARD, Elliot Fitch, American lawyer and journalist: b. Jamestown, N. Y., 25 July 1833; d. New York, 24 March 1893. He was graduated at the University of the City of New York in 1855 and was admitted to the Bar in 1858, afterward engaging in practice in New York. At the outbreak of the Civil War he was appointed aide-de-camp to Governor Morgan, with rank of colonel, and was assigned to recruiting service. He raised the 51st New York Volunteers, known as Shephard's Rifles, and was instrumental in enlisting a total of about 50,000 men. He founded the New York Bar Association in 1876 and remained in practice in New York until 1884. He bought the *Mail and Express*, New York, in 1888, thereafter editing it. He bitterly opposed Sunday traffic and travel and as owner of the Fifth Avenue stage line refused to permit its operation on Sunday.

SHEPHEARD'S CALENDAR. The 'The Shepherd's Calendar' was published anonymously in 1579, with a dedication "To the noble and vertuous gentleman most worthy of all titles both of learning and chevalrie, M. Philip Sidney." The book consists of 12 eclogues, each eclogue accompanied by a commentary or glossary that gives the argument and the meaning of unusual words; and purports to be written by E. K., a friend of the poet's identified by some scholars with Edmund Kirke, a college-mate of Spenser's, and by others with Spenser himself. The whole is introduced by a "General Argument" and an epistle to Master Gabriel Harvey of Cambridge. The 'Calendar' was an immediate success. It went through five editions during Spenser's lifetime, the first in 1579, and then in 1581, 1586, 1591, 1597; and was regarded as one of the high-water marks of English poetry. 'The Shepherd's Calendar' is descended from many sources. From the eclogue end its origins were in Theocritus most of all, and to varying degrees in Bion, Vergil, Petrarch and Boccaccio, Mantuan, Sannazaro and Marot. In metres and rhythms, of which Spenser attempts a wide variety, his main sources are Chaucer in particular, Surrey, Marot, and the old ballads. The language of the book marks Spenser as a daring innovator in poetic diction. It consists of words and forms from Lancashire and other dialects, of colloquialisms, old literary words, obsolete expressions, the best of contemporary poetic diction, and coinages in words and in forms, often happy, sometimes far-fetched, of Spenser's own.

The single eclogues employ the traditional devices: the monologues, the two- and three-part dialogues, the singing contests and the stories. The scheme of an eclogue to the month, following the general plan of country almanacs was original. But this motive is followed only indifferently; in October not at all, quite fully in the January, February, November and December divisions. In like manner the romance of Colin's love for Rosalynd also runs through some of the eclogues and is absent from others. The two motives combine to make the framework of the poem.

There is probably no one book in English that looks in so many poetic directions as 'The Shepherd's Calendar.' It is the work of a young writer possessed of enthusiasm, the splendor and excitement of the Renaissance, wide taste and reading, and one of the supreme lyrical gifts in all poetry for tone, rhythm, ornament and the enveloping glamor of a beautiful and rare spirit and mentality. Most of Spenser's later work finds its beginnings in the 'Calendar'; and though he progressed far beyond it in every way, in profundity of content, in rhythm and imagery, the progression was in almost every case directly from the qualities of his first work. As the poet's poet, which he undoubtedly is, Spenser stands from the first revealed. In 'The Shepherd's Calendar' lovers of Milton will find many of his qualities predicted, and to a varying extent the same is true of Shakespeare, Keats, Chatterton, Blake, Coleridge, Wordsworth and Tennyson, to mention only a few of Spenser's debtors.

STARK YOUNG.

SHEPHERD, Francis John, Canadian physician: b. Cavagnol, Quebec, 25 Nov. 1851

He was graduated M.D. at McGill University in 1873 and later studied in England, France, Germany and Austria. He was associated with the medical faculty at McGill from 1875 and from 1883 was professor of anatomy there, becoming dean of the medical faculty in 1908. From 1883 he was senior surgeon of the Montreal General Hospital. He was president of the Canadian Medical Association in 1901. He is joint author of 'American Text-Book of Surgery' (1892); 'Retrospect of Surgery' (3 vols., 1881-94) and editor of 'Robert Craik's Addresses' (1907).

SHEPHERD, William Robert, American historian and educator: b. Charleston, S. C., 12 June 1871. He was graduated at Columbia University in 1893 and later studied at the universities of Berlin and Madrid. He was a member of the faculty at Columbia from 1902 and from 1912 was professor of history there. He has specialized in United States colonial history and in that of Latin America. He is honorary professor of the University of Chile. Author of 'History of Proprietary Government in Pennsylvania' (1896); 'Battle of Harlem Heights' (1898); 'The Cession of Louisiana to Spain' (1904); 'Passing of New Amsterdam' (1912); 'Central and South America' (1914); 'Latin America' (1914); 'Expansion of Europe' (1915); 'Commonsense in Foreign Policy' (1917), etc.

SHEPHERD OF HERMAS. See HERMAS, SHEPHERD OF.

SHEPHERD KINGS. See HYKSOS.

SHEPHERD'S PURSE, a small cruciferous weed (*Capsella bursa-pastoris*). It has rosettes of lobed or pinnatifid leaves, a short stem, branching into spreading pedicels carrying racemes of small white flowers, rapidly succeeded by triangularly heart-shaped capsules, which have suggested this name and also those of mother's heart, case-weed, shepherd's bag, etc., by their resemblance to ancient wallets. Originally European, this plant has been naturalized throughout the temperate regions, blooming during the entire year, and was formerly used as an anti-scorbutic and in hæmaturia.

SHEPHERDSTOWN, W. Va., town in Jefferson County, on the Potomac River and on the Norfolk and Western Railroad, about 65 miles west of Washington, D. C., and 10 miles above Harper's Ferry. It was settled in 1732; but there is good reason to believe a settlement was made as early as 1718 by German colonists from Pennsylvania. In 1762 it was incorporated as a town; first called Mecklenburg and afterward changed to Shepherdstown. It is in an agricultural region. The chief manufactory is a knitting factory. Other industrial establishments are a flour mill, machine shop and cement-works. There are several churches, some of which are exclusively for the colored inhabitants. The educational institutions are Shepherd College, State Normal School and graded public schools. The government is vested in a mayor, recorder and a council of five members, elected annually. Pop. 1,276.

SHEPHERDSTOWN, Engagements at and Near. Situated in a great bend of the Potomac, nine miles east of Martinsburg and on one of the principal routes from the Shenandoah Valley to Maryland, Shepherdstown, W. Va., was the scene of much activity during

the Civil War. Both armies, at various times, crossed the Potomac at a ford about one mile below the town, which was used by the Confederates when they withdrew from the Antietam battlefield, 18-19 Sept. 1862, and by a great part of Lee's infantry when they marched to Gettysburg in June 1863. On 25 Sept. 1862 General Pleasonton's cavalry division crossed the ford on a reconnaissance toward Martinsburg and a few miles beyond Shepherdstown encountered the Confederates in some force, and was checked after capturing a few men. Again (1 Oct. 1862) Pleasonton crossed the river, with 500 cavalry and a battery of six guns, drove the Ninth Virginia cavalry from Shepherdstown and pursued it across the Opequon and into Martinsburg, where he encountered the rest of Col. W. H. F. Lee's brigade and a battery, both of which were driven from the place. Pleasonton remained in the town until 5 p.m., when he started on his return march, followed by Confederate cavalry and two guns, with whom about dark he had an encounter when within a mile of Shepherdstown, after which he recrossed the Potomac. The loss was slight on both sides. On 16 Oct. 1862 in co-operation with General Hagcock's division, which advanced from Harper's Ferry toward Charlestown and Winchester, General Humphreys, with about 500 cavalry, 6,000 infantry and six guns, marched from Sharpsburg, crossed Shepherdstown Ford at 4 A.M., and moved toward Smithfield on a reconnaissance. A mile out of Shepherdstown his advance was contested by Fitzhugh Lee's cavalry brigade and two guns. Lee was driven beyond Kearneysville, where he was reinforced by cavalry and a brigade of infantry, but was driven back, and Humphreys went into bivouac. The latter resumed his march on the morning of the 17th, and one and a half miles beyond Kearneysville came upon Lee in a strong position. Not desiring to bring on an engagement, and having his cavalry make a dash on Smithfield, which was found occupied by Confederate cavalry, Humphreys returned to Sharpsburg by the way he had gone out, followed by cavalry and artillery as far as Shepherdstown.

After his Gettysburg campaign, Lee recrossed the Potomac at Williamsport 14 July 1863. On that day, to watch his movements, General Gregg's cavalry division was sent across the Potomac at Harper's Ferry, and on the 15th marched to Shepherdstown, driving some cavalry from the town that evening and encamping nearby. On the 16th, about 1 p.m., Gregg's advance near Kearneysville was attacked by Fitzhugh Lee, with his own and Chambliss' brigade, supported by Jenkins' brigade. Gregg was gradually driven back upon his guns, when he rallied his command, and the sharp engagement was continued, lasting until dark, both sides dismounted. This engagement was on the Boteler farm, about a mile from town. During the early morning Gregg fell back to Harper's Ferry, with a loss of 70 killed, wounded and missing as the result of his fight on the 16th. The Confederate loss was 106.

On 21 Aug. 1864 Sheridan fell back from the line of the Opequon to Halltown, near Harper's Ferry, the cavalry, under General Torbert, being moved to his right at and near Shepherdstown. General Early demonstrated

on the position at Halltown for three days, and on the 25th with the four infantry divisions of Rodes, Ramseur, Gordon and Wharton, with their artillery, moved northward toward Shepherdstown, his cavalry at the same time moving on Williamsport to keep up the impression of an invasion of Maryland and Pennsylvania. Between Lee Town, seven miles southwest of Shepherdstown and Kearneysville, Early came upon Merritt's and Wilson's cavalry divisions, under Torbert, who had marched from Shepherdstown and Duffield's that morning on a reconnaissance to Lee Town. Torbert promptly attacked Wharton's division, Early advanced and drove it back in confusion nearly a mile. Early brought up the rest of his command, and after a short and sharp contest in which artillery was freely used, Torbert ordered his two divisions to fall back, Wilson's by the route it had come, and Merritt's by the direct road to Shepherdstown. Merritt was followed so closely by Early that when near Shepherdstown on the Charlestown road, Custer's brigade was ordered out to repel the advance, in which it succeeded, driving it back; but it was in turn struck in flank and rear by Gordon's division, which had marched across the country. Devin's brigade was sent to Custer's relief, and engaged Gordon. Custer was cut off and, after a sharp fight, made his escape by crossing the Shepherdstown Ford into Maryland. It was now dark; Merritt rejoined Wilson and both joined Sheridan. The loss was considerable on both sides. Early encamped near Shepherdstown, and next day moved back across the Opequon, and on the 27th to Bunker Hill. (See CIVIL WAR IN AMERICA). Consult Dandridge, Mrs. D., 'Historic Shepherdstown' (Charlottesville, Va., 1910).

E. A. CARMAN.

SHEPHERDSTOWN (Boteler's) FORD Engagement at. General Lee withdrew from the field of Antietam during the night of 18 Sept. 1862 and recrossed the Potomac into Virginia by the Shepherdstown or Boteler's Ford, one mile below Shepherdstown and about two and one-half miles from Sharpsburg. Leaving some artillery and two small infantry brigades at the ford to hold McClellan in check, he marched his army for the Opequon. On the morning of the 19th Pleasonton's cavalry followed Lee to the Potomac, and in the evening detachments of the Fifth corps forded the river, drove away the Confederate infantry, and seized some of the artillery. To ascertain how far Lee had retreated, General Porter was authorized by McClellan to send a reconnaissance beyond the Potomac on the morning of the 20th, and Porter ordered over the divisions of Generals Morell and Sykes. Before daylight two regiments crossed with spare horses, secured three guns that had been taken the night before, and took them to the Maryland side. At 8 o'clock Sykes crossed the river with Lovell's brigade of regulars and pushed out a mile on the Charlestown road, when he discovered the Confederates in force, upon which Lovell fell back, skirmishing, to the heights near the river, and Warren's small brigade of two regiments formed on his left. The Confederates encountered were Gen. A. P. Hill's division of six brigades, supported by three brigades under

General Early, all sent back by Lee when he heard that the Union advance had crossed the river. Hill's skirmishers had slowly pressed back Lovell, and meanwhile Barnes' brigade of Morell's division had crossed the river, under orders to go on the road to Shepherdstown; but Sykes ordered it straight to the top of a high steep bluff on the river bank to connect with Lovell's right. Before Barnes' brigade had all taken position Sykes came to the conclusion that he was too largely outnumbered to remain on that side of the river, and ordered the troops to recross, which was done by the left in good order, under cover of a heavy artillery fire from the Union batteries on the Maryland side; but the withdrawal on the right was not accomplished without disaster. The 118th Pennsylvania or "Corn-Exchange" regiment, 737 officers and men, had ascended the high bluff, and was not fairly in position when it was attacked by five brigades of A. P. Hill's division. It made a good fight, but was attacked on both flanks and in front. Colonel Prevost was wounded, and it was driven in disorder over the precipitous rocky bluff, many being killed and wounded in falling to the roadway below. The men began to cross the river, and the Confederates, advancing to the bluff, fired upon them as they were struggling to regain the opposite shore. Some were killed in the water; some were drowned; others, who took refuge in old lime-kilns on the bank of the river, were killed or wounded by careless firing of the Union batteries; and some surrendered. In this disastrous affair the regiment lost 53 killed, 10 wounded, and 105 missing, or 269 out of a total brigade loss of 317. A. P. Hill's loss was 30 killed and 231 wounded. The Union loss on the 19th and 20th was 71 killed, 161 wounded and 131 missing; the Confederate loss, 33 killed and 252 wounded. After the engagement of the 20th A. P. Hill and Early marched from the field and joined the main body of the army, which bivouacked that night on the Opequon near Martinsburg. Consult 'Official Records' (Vol. XIX); Smith, 'History of the 118th Pennsylvania Volunteers.'

E. A. CARMAN.

SHEPLEY, shēp'li George Foster, American soldier and jurist: b. Saco, Me., 1 Jan. 1819; d. Portland, Me., 20 July 1878. He was graduated from Dartmouth in 1837, from the Dana Law School at Cambridge in 1839, and admitted to the bar in 1840. He settled in Portland in 1844, where he established a large practice and in 1848-49 and in 1853-61 he was United States attorney for Maine. In 1861 he was commissioned colonel of volunteers in the Union army, participated in General Butler's expedition against New Orleans, commanded as acting brigadier-general at Ship Island, and after the capture of New Orleans was appointed military commandant, acting mayor, and was in charge of the defenses of the city until 1862 when he was appointed military governor of Louisiana and commissioned brigadier-general of volunteers. He commanded the military district of Virginia and North Carolina in 1864, was with the army of the James in 1864-65, and entered Richmond 3 April 1865. He was appointed military governor of the city and held the command until June when he resigned and resumed his law practice. From 1869 until his

death he served as United States circuit judge of the First Judicial Court of Maine. His decisions appear in Holmes' 'Reports' (1877).

SHEPPARD, Edmund Ernest, Canadian journalist: b. South Dorchester, Ontario, 29 Sept. 1855. He was educated at Bethany College, West Virginia, and engaged in journalism in the southern United States. After his return to Canada he was editor of the *Saint Thomas Journal* in 1881-83; editor-in-chief of the *Toronto News* in 1883-87; of the *Toronto Saturday Night*, which he founded, in 1887-1906; and editor-in-chief and owner of the *Toronto Star* in 1895-97. He represented the Dominion government on a commercial mission to Central and South America in 1897. Author of several novels, 'Dolly'; 'The Wisdom of Jones,' etc.

SHEPPARD, John (Jack), English criminal: b. Stepney, Dec. 1702; d. Tyburn, 16 Nov. 1724. He was brought up in the workhouse of Bishopsgate, his father having died the year after his birth. He was apprenticed to a carpenter, but falling in with bad company deserted his master and took to a life of thieving. He was first brought up in court in 1723 as a runaway apprentice, but having secured his release, he thenceforth, as he confessed, fell to robbing almost everyone that stood in his way. Having offended Jonathan Wild, a broker of stolen goods and informer against thieves, his capture was effected 23 July 1724. He was tried at the Old Bailey and condemned to death, but before his execution was effected he escaped from prison twice. He was hanged at Tyburn in the presence, it is said, of over 200,000 people. He was celebrated by all the journals and chapbooks, and even by the divines, who exhorted their flocks to emulate him in a spiritual sense. Plays have been constructed around his personality and Harrison Ainsworth made him the hero of his novel 'Jack Sheppard' (1839).

SHEPPARD, Morris, American politician: b. Wheatville, Morris County, Tex., 28 May 1875. In 1895 he was graduated at the University of Texas and subsequently studied at Yale. In 1898-99 he practised at Pittsburg, Tex., and since 1899 at Texarkana. On 15 Nov. 1902 he was elected to the 57th Congress for the unexpired term (1902-03) of his father. Mr. Sheppard was re-elected to the 58th, 59th, 60th, 61st and 62d Congresses (1903-13) from the first Texas district. On 29 Jan. 1913 he was elected United States senator for the unexpired term (ending 4 March 1913) of Joseph W. Bailey, and on the same day was elected for the term 1913-19. He was re-elected to the Senate in 1919.

SHERATON, shēr'a-tōn, Thomas, English furniture designer and cabinet-maker: b. Stockton-on-Tees, 1751; d. London, 22 Oct. 1806. He was apprenticed to a cabinet-maker and was self-taught in drawing and geometry. He settled in Soho square, London, about 1790 and there began the publication of the books of furniture designs which place him in the front ranks of English furniture designers. He appears to have had a small shop, but very little of his work is known to be in existence. He made a scanty living through the sale of his books, by teaching drawing, occasional preaching in Baptist chapels, and the publication of a number of religious books. He failed to

achieve personal success, his talents and tastes being too much diversified and untrained for concentrated endeavor. His furniture designs, however, had a far-reaching influence, as they were widely copied, and they remain unexcelled as models of exquisite taste and simplicity. His designs showed the square, tapering leg, simple lines and quiet ornament, marquetry being almost the only decoration he used. He used satinwood to a marked extent, and when he employed carvings they were of a flat description. His theory was that beauty in furniture lies in utility worked out through sound lines of construction. His later work shows an unfortunate departure from the rules laid down at the beginning of his career, his natural inventiveness being tempted by the vogue of the French Empire. In these he departed from his oldtime beauty and simplicity of line, and his influence is responsible for much of the grotesque carvings and ugly designs of the succeeding period. His name, however, is inseparably connected with his early designs. His books of designs are 'The Cabinet Maker and Upholsterer's Drawing Book' (111 plates, 1791; 2d ed., 119 plates, 1793-96; 3d ed., 122 plates, 1802); 'The Cabinet Dictionary' (1803); 'The Cabinet Maker and Artist's Encyclopedia' (30 parts, 1804-06). The last work was planned in 125 parts, of which but 30 were completed when he died.

SHERBROOKE, shér'brūk, Sir John Coape, English soldier: b. England 1764; d. Calverton, Nottinghamshire, 14 Feb. 1830. He was commissioned ensign in the army in 1780, served in Nova Scotia in 1784-85 and in 1796-1800 was on duty in India and South Africa. He was sent to Egypt to negotiate a treaty with the Beys in 1807, and in 1808 was in temporary command of all the troops in Sicily. He later served in Portugal, was second in command to Wellesley in the campaign of 1809, and was awarded a medal for gallant conduct at Talavera. In 1811 he became lieutenant-general and was appointed governor-general of Nova Scotia. He led a naval expedition to Maine in 1814 and captured some places on the Penobscot River. In 1816 he became captain-general and governor-in-chief of Canada. He resigned in 1818 in consequence of a paralytic stroke and lived the remainder of his life in retirement. Consult 'Dictionary of National Biography' (London 1897).

SHERBROOKE, Robert Lowe, Viscount. See LOWE, ROBERT.

SHERBROOKE, Canada, city, port and capital of Sherbrooke County, Quebec, on the Canadian Pacific, Grand Trunk, Boston and Maine and Quebec Central railways; 101 miles east of Montreal. The city is built on both sides of the Magog River at its junction with the Saint Francis and both rivers are crossed by fine bridges and afford abundant water power for manufacturing. The most important industry is the manufacture of woollen cloth, one mill employing over 1,000 persons; other manufactures are paper, cotton goods, carpets, clothing, foundry products, machinery, axes, bobbins, electrical supplies and cigars, and there are breweries, tanneries and flour and lumber mills. Copper, asbestos and chrome iron ore are mined in the vicinity. The local trade is important and lumber, paper pulp, as-

bestos, copper and lime are exported to the United States. It is the seat of a Roman Catholic bishop, and has fine county buildings, post-office building, several churches, an academy, good schools, banks and daily, semi-weekly and weekly newspapers. Pop. about 17,000.

SHERIDAN, Philip Henry, American soldier: b. Albany, N. Y., 6 March 1831; d. Nonquitt, Mass., 5 Aug. 1888. He was graduated at the United States Military Academy in 1853. He served in the 3d and 4th infantry regiments in the West until May 1861, when he was appointed captain in the 13th infantry. In December 1861 he was made quartermaster and commissary of the Union army in southwestern Missouri. He was Halleck's quartermaster during the Corinth campaign in 1862. In May 1862 he was appointed colonel of the 2d Michigan cavalry and was made brigadier-general of volunteers in July. He served with distinction in the battles of Perryville and Stone River (qq.v.), and was made major-general of volunteers 31 Dec. 1862. In 1863 he distinguished himself in the bloody battle of Chickamauga (q.v.), and also bore an important part in the battle of Chattanooga (q.v.), where he attracted the attention of General Grant, who, when he assumed command in Virginia, had Sheridan transferred (April 1864) to the Army of the Potomac as commander of the cavalry corps. Sheridan was actively engaged in the battles of the Wilderness, Spottsylvania Court House, Cold Harbor (qq.v.), etc. From 9-25 May 1864 he raided the Confederate communications around Richmond, destroying 10 miles of track on three important railroads, cutting the telegraph wires, capturing several trains and causing much alarm in the Confederate capital. On 28 May he fought the battle of Hawes' Shop (q.v.) and 11 June that of Trevilian's Station. Nearly every day in May, June and July Sheridan's cavalry was engaged with the Confederate troops or raiding their communications. On 7 Aug. 1864 he was placed in command of the Army of the Shenandoah with instructions to clear the Confederates out of the valley. He defeated Early at Winchester (q.v.) 19 September, and at Fisher's Hill 22 September and was rewarded by being made a brigadier-general in the regular army. After the battle of Fisher's Hill he laid waste the Shenandoah Valley. Practically everything destructible was destroyed and the horses, cattle and sheep were driven out. His object in devastating the country was to prevent future expeditions by the Confederates up the valley by destroying the means of subsistence. The non-combatants were reduced to the verge of starvation, and Sheridan has been much censured for his course. On 19 Oct. 1864 his army was surprised and routed in the battle of Cedar Creek (q.v.) by Early, who neglected to pursue. Sheridan, who was 20 miles away when the battle began, made his famous ride, rallied his demoralized troops, returned and decisively defeated the army of Early. On 8 Nov. 1864 Sheridan was made major-general in the regular army. From 27 Feb. to 24 March 1865 he made a raid from Winchester to Petersburg, cutting three railroads, two canals, telegraph wires, destroying supplies, and leaving only one line of railroad by which supplies could

be brought to Lee's army. During this raid he defeated Early again at Waynesborough (q.v.). At Five Forks (q.v.) 1 April Sheridan turned Lee's flank, forcing him to evacuate Petersburg and begin the retreat to Appomattox. In the pursuit of Lee, Sheridan took a leading part, and when he had placed his army squarely across the Confederate line of march at Appomattox Court House the surrender took place (9 April).

From May 1865 to March 1867 Sheridan commanded the Military Division (later Department) of the Gulf. His strong force on the Mexican border encouraged the Liberals and forced the French to withdraw their support from Maximilian. In his 'Personal Memoirs' Sheridan states that material assistance was secretly given by the United States authorities to the Liberal army under Juarez, 30,000 muskets at one time being sent to the latter from the United States arsenal at Baton Rouge. After the passage of the reconstruction acts, in March 1867, Sheridan was placed in command of the fifth Military District, consisting of Louisiana and Texas, with headquarters at New Orleans. His career as military governor was a stormy one. He was in favor of radical measures in dealing with the conquered Southerners, and in the troubles that arose in his district he was supported by General Grant and opposed by President Johnson, who sent several messengers to him in the endeavor to influence him to a more moderate course. Sheridan, believing that severe measures were necessary, refused to conform to the suggestions of the President's agents, and Johnson, after Sheridan's wholesale removal of civil officers, relieved him from command of the Fifth Military District in September 1867. General Grant strenuously protested, but Johnson was firm and Sheridan was transferred to the Department of the Missouri. In 1869, when General Grant became President, Sheridan was made lieutenant-general. In 1870-71 he was with the German armies observing the campaigns of the Franco-German war; in 1875 was again sent to New Orleans on account of the political riots in that city; in 1878 commanded the Western and Southwestern Military Divisions; in 1883 succeeded Sherman as commander-in-chief of the army; and in 1888 was made general. In person, General Sheridan was short and stout, with rather harsh features. In manner he was gruff, but not unkind. He was trusted by his soldiers, who called him "Little Phil" and believed him invincible. He married, in 1879, Miss Rucker, daughter of Gen. D. H. Rucker of the United States army. In religion, General Sheridan was a devout Roman Catholic. He always refused to enter politics. An equestrian statue has been erected in his honor at Albany, N. Y.

Consult Sheridan, 'Personal Memoirs' (1888); Davies, 'General Sheridan' (1895); Newhall, 'With General Sheridan in Lee's Last Campaign' (1866).

WALTER L. FLEMING,
Professor of History, Vanderbilt University.

SHERIDAN, Richard Brinsley, English dramatist, orator and statesman: b. Dublin, Ireland, 30 October 1751; d. London, 7 July 1816. His father, Thomas Sheridan, was an actor; his mother was a dramatist and novelist.

At the age of seven he was taken to London. From 1762 to 1768 he attended Harrow school, where, in collaboration with a fellow-pupil named Halhed, he wrote a farce called 'Jupiter.' In 1771 he moved to Bath, where he learned at first hand the foibles of the fashionable world. Among the people that he met was the eminent composer, Thomas Linley. Linley's daughter, well-known as a singer, was a lovely and coquettish girl with many admirers. To shield her from the persecutions of a Major Mathews, Sheridan arranged to escort her to a French convent. Near Calais he became secretly married to her; his age was 21 and hers 18. Linley brought them back to Bath and separated them. After his return, Sheridan fought two duels with Mathews, disarming his opponent the first time and being himself seriously wounded the second. On 13 April 1773, he married Miss Linley openly.

At a very early age he began writing for the theatre. On 17 January 1775, his farce-comedy, 'The Rivals,' was produced at Covent Garden. It failed and was withdrawn. In a revised form it reappeared on 28 January, and is still being played. His farce, 'Saint Patrick's Day,' was first acted on 2 May 1775. It was followed on 21 Nov. 1775, by 'The Duenna,' a comic-opera, whose great success eclipsed the popularity of Gay's 'Beggar's Opera.' In 1776 he succeeded Garrick as manager of the Theatre Royal, Drury Lane. He was careless in business, but his personal popularity atoned for his practical shortcomings. He produced a revision of Vanbrugh's 'Relapse,' called 'A Trip to Scarborough,' 24 Feb. 1777. On 8 May 1777, he presented at Drury Lane one of the greatest comedies of all time, 'The School for Scandal.' He was then only 25. A farce called 'The Critic,' in which he satirized his jealous rival, Cumberland, was performed 29 Oct 1779. This practically closed his career as a dramatist; though on 24 May 1799, he produced 'Pizarro,' a melodrama adapted from the German of Kotzebue.

His gaiety and talent made him a great favorite in society. On 12 Sept. 1780 he was elected to the Commons for Stafford, and began a remarkable parliamentary career. He developed wondrous power as an orator, and was unexcelled for brilliancy and eloquence. He was conspicuous in the impeachment of Warren Hastings. On 7 Feb. 1787 his great speech before the House of Commons, relating to the Princesses of Oude, held his auditors enthralled for five hours and a half. Hardly less effective was his speech at the arraignment of Hastings in Westminster Hall, June 1788. Throughout his public career he maintained the reputation of a pure and independent statesman.

His wife died 1792; and on 27 April 1795 he married Esther Jane Ogle. His income from Drury Lane averaged £10,000; but he often overdrew his resources to lead a dazzling social life. From 1791 to 1794 the Theatre Royal was rebuilt at ruinous expense to Sheridan; and the destruction of the new house by fire in 1809 involved him in serious financial difficulties. In 1812 he failed of re-election to Parliament; and in August 1813 he was arrested for debt. His health, weakened by social dissipations, failed rapidly; and he died

GENERAL P. H. SHERIDAN

almost in want. He was buried in Westminster Abbey. (See *THE RIVALS; SCHOOL FOR SCANDAL*). Consult Rae, Fraser, 'Sheridan, a Biography'; Matthews, Brander, 'Introduction to Sheridan's comedies'; Oliphant, Mrs. M., 'Sheridan' (New York 1883); Sichel, W. S., 'Sheridan' (from new and original material including a manuscript diary by Georgiana, Duchess of Devonshire, Boston 1909).

CLAYTON HAMILTON,
Sometime Tutor in English, Columbia University.

SHERIDAN, Thomas, Irish clergyman, grandfather of Richard B. Sheridan (q.v.): b. County Cavan, Ireland, about 1684; d. Dublin, Ireland, 10 Sept. 1738. He was educated at Trinity College, Dublin; was at one time chaplain to the lord lieutenant and later secured a living through Dean Swift, of whom he was a close friend. He was noted for his wit and his gay carelessness, though his extravagance had reduced him to direst poverty. He wrote 'The Art of Punning,' translated Persius in prose and Sophocles' 'Philoctetes' in verse. His son THOMAS, elocutionist, father of Richard B. Sheridan, the dramatist (q.v.): b. near Dublin, Ireland, 1721; d. Margate, Kent, 14 Aug. 1788. He was educated at Trinity College, Dublin, became an actor and theatre manager and afterward was successful as a lecturer and teacher of elocution. He published 'Lectures on the Art of Reading' (1775); 'Dictionary of the English Language' (1780); 'Life of Dean Swift' (1784), etc.

SHERIDAN, Wyo., city and county-seat of Sheridan County, near the northern border of the State, 285 miles northwest of Cheyenne, on the Chicago, Burlington and Quincy Railroad. In this vicinity occurred three notable Indian battles, that at Wolf Creek under General Connor in 1865; the Fetterman fight on Massacre Hill in 1866, when all the whites were slain; and the Great Wagon Box fight in 1867. The place was settled in 1882 and incorporated in 1884. The State Hospital is located here. There are coal mines in the vicinity and the surrounding district is devoted to agriculture. Pop. 12,019.

SHERIF, shā-rēf, an Arabic title equivalent to noble. It is borne by the descendants of Mohammed, and descends both in the male and female line. Those who possess this rank are distinguished by green turbans and veils, green being the color of the Prophet. In India they are called Seyyed.

SHERIFF, an officer who represents the executive power of a county in the United States and is elected either by the legislature or the citizens. The requirements are controlled by statute, but usually they are that the person so elected must be over 21, a citizen of the United States and a resident of the county that he represents. Power to fill a vacancy occurring in the office of sheriff is regulated by statute. The sheriff is required to take a prescribed oath in order to qualify, and to furnish a bond for the faithful discharge of the duties of his office. The sheriff in person or by deputy executes civil and criminal process throughout the county; has charge of the prisoners, attends court and keeps the peace. His judicial authority is generally confined to ascertaining damages on writs of inquiry. He is not liable

for any errors in acting in a judicial capacity—the office is almost exclusively ministerial. A sheriff has the right, when it is reasonably necessary, to lawfully summon any citizen for assistance in the execution of his duty, and one failing to obey the summons is liable to indictment; he has also the right to appoint general or special deputies in such manner as may be prescribed by his jurisdiction; but the sheriff cannot delegate his authority to appoint a deputy. The sheriff is liable for all damages caused by any wrongful act of his office, and may be criminally liable for a wilful breach of his duty, if a corrupt motive is shown. A sheriff's sale is one conducted by a sheriff, or by a person by him deputized, of property held under proper authority.

SHERLOCK HOLMES, *Adventures of*, a collection of stories by Sir A. Conan Doyle (q.v.), in each of which Holmes figures as a scientific amateur detective of remarkable skill. He is enslaved to cocaine and in manner is brusque and eccentric; but by a method of *a posteriori* reasoning, applied to apparently unimportant facts of common life, he is enabled to uncover most remote and disconnected causes. The tales are full of bizarre and often gruesome details; the principal characters, Holmes and his friend Dr. Watson, appear to have been suggested to the author by Poe's 'Murders in the Rue Morgue.' The first series appeared in the *Strand Magazine*, London, and in book form in 1891.

SHERMAN, Frank Dempster, American poet: b. Peekskill, N. Y., 6 May 1860. He was graduated from Columbia in 1884 and subsequently studied at Harvard. For many years he has been a professor of graphics at Columbia. He has published 'Madrigals and Catches' (1887); 'Lyrics for a Lute' (1890); 'Little Folk Lyrics' (1892); 'Lyrics of Joy' (1904); 'A Southern Flight' (with Clinton Scollard, 1906); also several volumes of Sherman Family history.

SHERMAN, Henry Clapp, American chemist: b. Ashgrove, Va., 16 Oct. 1875. He was graduated at Maryland Agricultural College in 1893 and took his Ph.D. at Columbia University in 1897. He was investigator of nutrition for the United States Department of Agriculture in 1898-99; from 1897 was connected with the faculty at Columbia University, where he became professor of organic chemistry in 1907; and was head of the department of economy and food nutrition at Teachers' College 1909. He has been research member of Carnegie Institute since 1912. In 1915 he was major and member of the American Red Cross Mission to Russia. He edited the *School of Mines Quarterly* in 1906-09 and is author of 'Method of Organic Analysis' (1905; 2d ed., 1912); 'Chemistry of Food and Nutrition' (1911; 2d ed., 1916); 'Food Products' (1914); etc.

SHERMAN, James Schoolcraft, American politician and vice-president of the United States: b. New Hartford, N. Y., 24 Oct. 1855; d. Utica, N. Y., 30 Oct. 1912. He was graduated at Hamilton College in 1878, was admitted to the bar in 1880, and engaged in practice in Utica. He was mayor of Utica in 1884-85 and served in Congress in 1887-91 and 1893-1909. He was for many years promi-

nent in the affairs of the Republican party, was chairman of the Republican State Convention in 1895, 1900 and 1908, and in 1906 he was chairman of the Republican National Congressional Committee. He was elected vice-president of the United States in 1908, but died before the expiration of his term of office. He was renominated for the vice-presidency in 1912, but with President Taft, was defeated. He was a trustee of Hamilton College.

SHERMAN, John, American statesman: b. Lancaster, Ohio, 10 May 1823; d. Washington, D. C., 22 Oct. 1900. He was the eighth child in a family of 11, being the junior by three years of his brother Gen. William Tecumseh Sherman (q.v.). He attended about two years at Homer Academy, Lancaster, Pa., between 1835-37. After having secured an irregular and not very complete general education, he studied law and was admitted to the bar at 21. In 1848 he was a delegate to the National Whig convention at Philadelphia. In the same year he married and established a mill for lumber work, which he carried on together with his law practice. He was president of the first Republican convention in Ohio, held at Columbus, 13 July 1855, which nominated Salmon P. Chase for governor. In 1855 he was elected a member of the 34th Congress. He took a prominent part in the proceedings of the House; was on the Committee of Inquiry sent to Kansas, and wrote the report of its investigations. He was prominently identified with the support of all measures for the prosecution of the Civil War; defended the protective tariff, and the refunding of the National debt. He was a member of the committee that visited Louisiana to supervise the counting of the returns of that State, and a member of the Electoral Commission. In Congress, Mr. Sherman quickly demonstrated his exceptional power as a master of finance. He watched carefully the appropriation bills, speedily extended the credit of the government, and provided for its future support. When Salmon P. Chase resigned the United States senatorship from Ohio to enter the Cabinet of President Lincoln, as Secretary of the Treasury, Mr. Sherman was elected his successor and took his seat 4 March 1861. In 1881 he was re-elected to the Senate, where he remained until 1897, when he was appointed Secretary of State by President McKinley. He resigned that office, however, in 1898, on account of failing health. He was a candidate for the Presidential nominations in 1884 and 1888. Among his publications are 'Selected Speeches and Reports on Finance and Taxation' (1879); and 'Recollections of Forty Years in the House, Senate, and Cabinet' (1893). From 1860 to 1900, there was scarcely a great financial measure with which the name of John Sherman was not connected. Among these were the making of United States treasury notes legal tender, the enacting of the national banking bill, the refunding act of 1870, and the resumption of specie payments. The detailed record of measures by which the legal tender notes of the government reached par, and by which specie resumption became an accomplished fact at the time fixed for it, exhibits the man under whose leadership this was done as a financier of the highest order.

Consult 'The Sherman Letters: Correspondence between General and Senator Sherman from 1837 to 1891' (ed. by Rachel S. Thorndike, New York 1894); Atkinson, E., 'Senator Sherman's Fallacies; or, Honesty the best policy' (Boston 1868); Burton, T. E., 'John Sherman' (New York 1906); Walker, A. H., 'History of the Sherman Law of the United States' (New York 1910).

SHERMAN, Lawrence Yates, American lawyer and senator: b. Miami County, Ohio, 8 Nov. 1856. He was graduated at McKendree College, Illinois, in 1882, was admitted to the bar and engaged in practice. He was judge of McDonough County in 1886-90; served in the Illinois legislature in 1897-1905, being speaker in 1899-1903, and leader of the Republican party in his State; and in 1905-09 he was lieutenant-governor of Illinois. He was president of the United States Board of Charities in 1909-13. He was sent to the United States Senate in 1912 to finish the unexpired term of William Lorimer, and was afterward elected for the term 1915-21.

SHERMAN, Roger, American legislator: b. Newton, Mass., 19 April 1721; d. New Haven, Conn., 23 July 1793. He was apprenticed to a shoemaker when a child, but in 1743 he removed to New Milford, Conn., where he was engaged with his brother in keeping a small store. He studied law, politics and mathematics without a teacher, was appointed surveyor for his county in 1745 and for several years made the astronomical observations for an almanac published in New York. In 1754 he was admitted to the bar, served for several terms in the provincial assembly, and in 1761 removed to New Haven, Conn. He became judge of the Court of Common Pleas there in 1765 and served in that position and as judge of the Superior Court for 23 years. He was assistant governor in 1766-85, treasurer of Yale College in 1766-76, and a member of Congress from 1774-91, when he was elected senator in which capacity he served the remainder of his life. He was one of the committee of five to draft the Declaration of Independence which he afterward signed, was an active member of various war and ordnance committees, served on the treasury board and in 1777 was one of the framers of the original Articles of Confederation. He assisted in the codification of the laws of Connecticut, was a delegate to the Federal Constitutional Convention in 1787, where he played a prominent part, and from 1784 until his death was mayor of New Haven.

SHERMAN, William Tecumseh, American soldier: b. Lancaster, Ohio, 8 Feb. 1820; d. New York, 14 Feb. 1891; son of Judge Charles R. Sherman. His father died when he was about nine years old, and he was brought up in the family of Hon. Thomas Ewing, who procured for him an appointment as cadet at the United States Military Academy, West Point. He is described as having been at the time a tall, slim, loose-jointed lad, with red hair, fair, burned skin and piercing black eyes. In July 1840 he was graduated from the academy and appointed second lieutenant in the Third artillery, and first lieutenant Nov. 1841. He served in Florida until 1842, and was afterward in garrison at Fort Moultrie, S. C.

At the first rumor of war with Mexico he showed great impatience to be sent to Texas, but the War Department, instead, ordered him to California. The voyage appears to have made him strongly in favor of an interoceanic canal. He served in California as acting assistant adjutant-general of the department until February 1849, when he was transferred to similar duty on the staff of Gen. Persifor F. Smith who commanded the division of the Pacific. Having been ordered to New York as bearer of dispatches, he was married in January 1850 to Ellen Boyle, daughter of his foster-father, Hon. Thomas Ewing, then Secretary of the Interior.

In September 1850 Sherman was transferred to the commissary department with the rank of captain and stationed at Saint Louis and New Orleans. Shortly after his arrival at New Orleans he received notice of his appointment as partner in the banking firm of Lucas and Turner, a branch of Lucas and Simonds, of Saint Louis. Feeling that he could do better in business than in the army, he obtained a six months' leave of absence and started for California to represent the house. When the leave of absence expired he resigned from the army. Sherman at this time saw the danger of the slavery issue. "Unless people both North and South," he wrote in August 1856, "learn more moderation we'll see sights in the way of civil war."

Sherman removed to New York in 1857, and to Leavenworth, Kan., in 1858, where he practised law until July 1859, when he was elected superintendent of the proposed military academy in Louisiana. The institution was opened 1 Jan. 1860, as the Louisiana State Seminary of Learning and Military Academy, and Sherman remained its superintendent until 18 Jan. 1861, when he wrote to the governor asking to be relieved the moment the State determined to secede. His request having been granted, he went to Saint Louis in February 1861 and was for a short time president of a Saint Louis railroad company. While holding this place he was deeply interested in the approaching struggle between North and South, making valuable suggestions, some of which were shown by his brother, John Sherman, then in Congress, to Secretary of War Cameron. "On the necessity of maintaining a government, and that government the old constitutional one," he declared, "I have never wavered, but I do recoil from a war when the negro is the only question."

In May 1861 Sherman was appointed colonel of the 13th regular infantry, and 30 June he assumed command of a brigade of McDowell's army. He took an honorable part in the first battle of Bull Run; on 3 August received his commission as brigadier-general of volunteers, dating from 17 May, and 24 August was ordered to duty in the Department of the Cumberland, under Gen. Robert Anderson, whom he succeeded in command of the department 8 October. On the 26th of the same month he wrote that "to accomplish the only purpose for which Kentucky can be used there should be a force here of 200,000 men." In November Sherman, who was severely criticized by many for his assertions as to the number of men needed for the war in his section, was relieved

of his command and sent to Missouri. After a short leave at home he was employed for a time as commander of the camp of instruction at Benton Barracks, near Saint Louis. In February 1862 he was transferred to Paducah, Ky., where he organized the division which he subsequently commanded at Shiloh. In this hard-fought, two-days' conflict Sherman was severely wounded, and Grant declared that "to his individual efforts I am indebted for the success of that battle." Sherman was commissioned major-general of volunteers, 1 May, and in the same month compelled the Confederates to evacuate Corinth, which was followed, in July, by the occupation of Memphis. His campaign against Vicksburg proved unfortunate. He was defeated and driven back to Chickasaw Bayou, but afterward rendered effective aid to Grant in the operations which resulted in the surrender of Vicksburg.

Sherman was made a brigadier-general of the regular army in July 1863. After the fall of Vicksburg and Port Hudson the Western armies lay comparatively idle for a time, and early in the autumn Sherman was occupied in rebuilding the Memphis and Charleston railroad to the East, that the armies might draw supplies by that route. While engaged on this work he was ordered to cross the Tennessee and march eastward. The battle of Chattanooga, in which he distinguished himself, followed, and he was next sent to the relief of Burnside, besieged by the Confederates in Knoxville. Sherman forced Longstreet to raise the siege 5 Dec. 1863. After a few weeks in winter quarters in northern Alabama, Sherman in January 1864 made a raid across the State of Mississippi from Jackson to Meridian and back again, doing a vast amount of damage to railways, Confederate property and the country at large. Grant being invited to take unhampered command of the military forces of the United States and to repeat, if possible, in the East, the successes which had attended his career in the West, assigned Sherman to the command of the Military Division of the Mississippi, including the Departments of the Ohio, the Tennessee, the Cumberland, and the Arkansas, with temporary headquarters at Nashville, and with orders to move on Atlanta. With an army of about 100,000 men Sherman invaded Georgia. He was opposed by Gen. Joseph E. Johnston, with about 45,000 Confederates in excellent spirit and discipline, but poorly provided with munitions of war, as compared with the Union forces. Johnston engaged Sherman's army at Dalton, Resaca, Cassville, Dallas and Kenesaw Mountain. At the last-named place, 27 June, the Confederates, owing to the shortness of artillery ammunition, reserved their cannon for the final charge of the Union troops, receiving them with a destructive fire which won the day for the South.

Sherman's progress, however, could not be stayed, and the Richmond government, believing that Johnston was not doing all that could be done with the men at his command, relieved him and put Hood in his place. Sharp battles followed in the vicinity of Atlanta, and at length Hood was compelled to evacuate the city during the night of 1 September. Sherman issued an order that all the inhabitants should leave Atlanta, going North or South as they

saw fit, and offered transportation to that end. Mayor Calhoun and other citizens appealed in vain to have the order recalled. "You cannot qualify war in harsher terms than I will," answered Sherman, "war is cruelty and you cannot refine it." The order was carried out and approved by the authorities at Washington. Sherman gave as his reasons to his military superiors that he wanted all the houses for military and storage purposes, and did not wish to be burdened with the care of the inhabitants.

Sherman became convinced, after a series of indecisive operations against Hood, that the aim of the latter was to draw him out of Georgia. He determined on marching to the sea, cutting a swath of devastation through the heart of the Confederacy and destroying, as far as possible, the sources of Confederate supplies. Grant fully approved of the plan, and Sherman, after burning Atlanta, breaking up the railway, and sending a part of his army to reinforce Thomas at Nashville, started with about 70,000 men on his memorable march. He ordered his troops to forage liberally on the country and although foraging was supposed to be done by regular details only, it was, in fact, carried on practically without restriction, and the devastation along the line of march was most complete. The Confederates had virtually no force to oppose Sherman's advance and when the governors of Alabama, South Carolina and Georgia were appealed to from Richmond, the first mentioned replied that none but cripples, women and children, and very old men were left in the State. Sherman entered Savannah 23 December, having lost on his march from Atlanta, 103 killed, 428 wounded and 278 missing. Congress, 10 Jan. 1865, tendered the thanks of the people of the United States to Sherman and his command. He moved northward 1 February and occupied Columbia 17 February, the place being destroyed by a conflagration for which Sherman always claimed that he was not responsible.

General Johnston was recalled to command by the chiefs of the sinking Confederacy, and after several desperate encounters, Sherman and Johnston met at Durham Station, N. C., 18 April. The terms agreed upon were most liberal to the Confederates allowing them to deposit their arms at their State capitals, and providing for the recognition of their State governments. The terms were made subject to the approval of superior authority, and a suspension of hostilities was agreed upon to obtain that consent, 48 hours' notice to be given by either side before resuming hostilities. Lincoln had been murdered; there was a vindictive feeling toward the South at Washington, and Johnson and his Cabinet wholly disapproved Sherman's arrangement, and ordered Grant to take charge of Sherman's command. Grant, always generous in his recognition of Sherman's merits went to Raleigh, as directed, but left to Sherman the honor of receiving Johnston's surrender on the same terms as those granted to Lee. Sherman keenly felt what he regarded as unjust treatment on this occasion by Secretary of War Stanton and declined publicly to take Stanton's proffered hand at the great army review in Washington 24 May 1865.

Sherman was appointed to command the

military division of the Mississippi 27 June 1865; promoted to lieutenant-general 25 July 1866, and assigned in August to the Military Division of the Missouri. On the accession of Grant to the Presidency, Sherman succeeded to the command of the army as general. About this time he wrote "I do think some political power might be given to the young men who served in the rebel army, for they are a better class than the adventurers who have gone South purely for office." Sherman retired 8 Feb. 1884, taking, to the last, an active interest in public affairs. A splendid equestrian statue, by Saint Gaudens, presenting Sherman in characteristic attitude as when he rode at the head of his army, was unveiled at the southeastern entrance of Central Park, New York, in 1903, and another handsome equestrian statue of the great general was dedicated in Washington the same year, President Roosevelt taking part in the ceremonies. The Washington statue stands on the spot whence Sherman reviewed the grand march of the Union army in 1865.

SHERMAN, Tex., city, county-seat of Grayson County, on the Houston and Texas Central Railway, on the Missouri, Kansas and Texas Railway of Texas; Saint Louis and Southwestern Railway; Missouri, Oklahoma and Gulf Railway; Saint Louis and San Francisco Railway; Texas and Pacific Railway and the Texas Traction Company; 12 miles south of the Red River and 728 feet above the sea. Sherman is in the Red River Valley and is the home of the Red River Valley Fair, said to be the largest free fair in America. The northern half of Grayson is sandy loam, and from it large quantities of fruit and vegetables are raised and shipped, while the southern half is of the black waxy type, especially suited for cotton and grain farming. The breeding of registered horses, cattle and hogs is practised extensively and with profit in all parts of the county. The city is the most accessible point in north Texas having 108 passenger trains, interurban and motor cars over the railroad lines in and out daily. There are 350 miles of piked highways in Grayson County which radiate out of Sherman. One of the greatest Oklahoma oil fields is just across the Red River from Grayson County. As one of the leading manufacturing cities of Texas, Sherman turns out \$25,691,000 worth of goods per year. Among the products manufactured

are cigars, candy, medicines, overalls, cotton duck, creamery butter, and more grains, cotton and oil products than any other point in Texas. The laundries of the city are said to cover a larger area of outside business than those of any other State. The educational institutions are the Austin College, State Presbyterian College for boys, Kidd-Key College and Conservatory of Music, Saint Joseph's Academy, Catholic School for girls and the Sherman Business College. Sherman has also an excellent public school system for both races; and \$100,000 bonds are being issued to add to the present high school. There are two hospitals, Saint Vincent's Sanitarium and the Sherman Hospital, both being well-equipped institutions. There has recently been left to Sherman \$100,000 by Wilson N. Jones, former governor of Oklahoma, for the purpose of providing hospital facilities for the sick poor. Among the public buildings of note are the Federal building, the Carnegie library, the Sherman Hall at the Austin College and the Y. M. C. A. building. The combined assets of the banks of Sherman total \$9,562,364. Council-commission-manager form of government was adopted in 1915 and is proving very successful. Pop. about 15,000.

SHERMAN ACT, an act of the United States Congress, approved 14 July 1890. It was the culmination of a long disagreement between the two houses over a financial policy, neither side being disposed to yield. This bill was supported by Senator Sherman and others as a compromise measure. It instructed the Secretary of the Treasury to buy silver bullion to the amount of 4,500,000 ounces a month, and to issue treasury notes in payment. Though the bill was approved, the financial policy continued to be a disturbing question and arguments favoring a repeal were presented at almost every opportunity. The business depression of the summer of 1893 was alleged to be a consequence of the bill, and President Cleveland summoned Congress to convene in special session, 7 August. A bill to repeal the silver-purchasing proviso of the Sherman Act passed the House 28 August. In the Senate, the Voorhees bill was presented as a substitute, its provisions being a repeal of the silver-purchasing clause, but affirming bimetallism as a national policy. After a protracted contest the Voorhees bill passed the Senate 30 October. It was concurred in by the House 1 November, and the President approved it the same day.

SHERILL, Charles Hitchcock, American lawyer: b. Washington, 13 April 1867. He received his education at Yale, being admitted to the bar in 1891. In 1909 he became United States Minister to Argentina, but, although later offered the ambassadorship to Japan, ill-health forced him to refuse the post, and in 1912 he resumed the practice of law. He became adjutant-general of New York State a few years later. He is the author of 'Stained Glass Tours in France' (1908); 'Stained Glass Tours in England' (1909); 'French Memories of 18th Century America' (1915); 'Modernizing of the Monroe Doctrine' (1916).

SHERRY, a favorite Spanish wine, so called because chiefly produced in the neighborhood of Xeres de la Frontera, near Cadiz, in Andalusia, Spain. Unlike many of the French

wines, the manufacture of sherry is carried on chiefly by a few large concerns. The industry has principally passed to French and British proprietors, who have greatly improved the manufacture and have bettered the grade of commercial sherries. The best soil consists chiefly of carbonate of lime, with a small admixture of silex and clay, and occasionally magnesia. Red and white grapes are used indiscriminately. When ripe and gathered they are spread on mats, and left to dry for two or three days; they are then freed from the stalks, and the rotten or unripe berries rejected. Being now introduced into vats, with a layer of burned gypsum on the surface, they are trodden by peasants with wooden shoes. The juice is collected in casks, in which the fermentation is allowed to take place, continuing generally from October till the beginning or middle of December. The wines are then racked from the lees, and those intended for exportation receive additions of brandy, seldom more than three or four gallons to the butt. The new wine is harsh and fiery, but mellows by being allowed to remain in the wood four or five years, though 15 or 20 years are required to perfect its flavor. Sometimes bitter almonds are infused to give the wine a nutty flavor. The dry sherry, that which is least sweet, is the most esteemed. The finest variety of sherry is the Manzanilla sherry, the excellent qualities of which are determined by the nature of the soil and the lay of the district in which it is grown; Amontillado and Montilla sherries and Vino de Pasta are also highly esteemed. The sherry wines are shipped for the most part at Cadiz, and are principally exported to England. No wine is more largely imitated and adulterated than sherry. See LIQUOR AND THE LIQUOR TRAFFIC; WINE AND WINE MAKING.

SHERWOOD, William Hall, American pianist: b. Lyons, N. Y., 31 Jan. 1854; d. Chicago, Ill., 7 Jan. 1911. He appeared in concerts at the age of nine years and later studied under William Mason. In 1871-76 he studied in Europe under Kullak, Richter, Doppler and Weitzman. He appeared as a performer at the Beethoven Festival at Berlin and with Liszt at Weimar and received flattering offers to remain abroad. He returned to the United States in 1876 and settled in Boston teaching music at the New England Conservatory, and after 1889 he lived in Chicago, where he was head of the Chicago Conservatory until 1897; he then resigned to establish the Sherwood Piano School. He was widely known as a concert pianist, and gave recitals in all the larger cities of the United States.

SHERWOOD FOREST, an ancient forest in the west of Nottinghamshire, England, in a hilly district between Nottingham and Worksop. The tract covered about 200 square miles and was formerly a royal forest, famous as the scene of the exploits of Robin Hood and his merry men, many legends of whom are yet to be heard in the surrounding country. Only a small portion of the forest, near Rotterham, still remains. The rest of the country it once covered is now occupied by country-seats and private parks, and is for the most part bare of trees. The town of Mansfield and several villages are within the ancient bounds, which were about 25 miles from north to south and six to

eight miles from east to west. Consult works by Sissons (1888) and White, R., 1875.

SHETLAND, or **ZETLAND**, Scotland, a county embracing the group of more than 100 islands, islets and skerries northeast of Orkney, of which 27 are inhabited. They form the northernmost county of Scotland; the capital, Lerwick, is 116 miles northeast of Kirkwall, 300 miles north by east of Edinburgh, and 223 miles west of Bergen, Norway. The islands extend 70 miles and 36 miles in extreme breadth. They contain 566 square miles, and the largest are Mainland, Yell, Unst, Fetlar, Bressay, Whalsay and Foula. Mainland contains about two-thirds of the entire acreage; its surface is hilly with indented coast line and interspersed by numerous lochs. Ronas Hill (1,475 feet) is the highest point in the northwest of Mainland: The Sneug (1,372 feet), in Foula, is next in height. The coasts of the whole group are bold and rocky, presenting some fine landscape. Peat moss covers much of the surface, and some cereal crops and vegetables are grown. The pastures cover about 43,000 acres. Domestic animals are reared—the small Shetland ponies are well known—but the chief industry consists in the herring fisheries. The manufactures are mainly woolens. The capital, Lerwick, is on Bressay Sound, and Scalloway, the largest village,—both in Mainland. The exports are fish, oil, cattle, horses, eggs and gloves. There are 61 public schools, church schools and several schools for superior education. The inhabitants are of Norse extraction and were for several centuries under Scandinavian sovereignties. Norse was still spoken in Foula at the end of the 18th century. Since 1468 the islands have belonged to Scotland. There are numerous antiquities which are highly interesting, including brochs, standing-stones, tumuli and the ruins of a Roman camp on Fetlar Island. Pop. about 28,000.

SHEWBREAD, shō'brəd, the 12 unleavened loaves placed upon a table in the outer department of the Jewish sanctuary. The number 12 represented the 12 tribes. The loaves were placed in two piles, one above another, and were changed every Sabbath day by the priests. The removed bread became the property of the priests, who alone had a right to eat of it, and only in the holy place. In cases of emergency, however, they incurred no blame by giving it to persons who were in a state of ceremonial purity, as in the instance of David and his men (1 Sam. xxi, 4-6; Matt. xii, 4).

SHIAHS, shē'ās. See **RELIGIOUS SECTS**; **SHIITES**.

SHIBBOLETH, a word which on a certain occasion served as a test to distinguish Ephraimites from Gibeonites. Jephtha's men, Gibeonites, held the ford of Jordan, with orders to suffer no Ephraimite to cross over. When challenged with the question "Art thou an Ephraimite?" the man of Ephraim would answer "Nay." "Say now Shibboleth"; and the other pronounced it "Sibboleth," "for he could not frame to pronounce it right." In the Septuagint version, which is followed by the Latin Vulgate, the "point" of the question is completely lost: "Art thou not an Ephraimite?" and they said "Nay." And they said to him, "Then say *stachys*," that is, "say ear" (of corn), which is

the etymological meaning of the Hebrew word *shibboleth*: "and he framed not to speak so."

SHIBUSAWA, shē'boo-sā'wa, **Ei-ichi**, **BARON**, Japanese banker: b. Saitama prefecture, 2 Feb. 1840. He entered government service at Tokio under the Tokugawa Shogunate when still a youth, and traveled in Europe in 1867-68 as companion to one of the Tokugawa princes. Upon the establishment of the Imperial government in 1869 he was appointed to a high office in the Treasury, but resigned in 1873 because of a disagreement concerning the fixing of expenditures for the government departments, and held no other government position, despite frequent offers. He founded the first national bank, known as the First Bank, in 1873, and became a power in the Japanese financial world. He established a commercial training school, out of which grew the Tokio Higher Commercial School; inaugurated the Tokio Chamber of Commerce in 1878, and served as its chairman until 1905, when illness forced his retirement from business. He returned to active life for a short time after the Russo-Japanese War. He first visited the United States in 1902, and re-visited it in 1909 and 1915. For his many public services he was created baron in 1900.

SHIELD, shēld, **William**, English composer: b. Swalwall, Durham, 5 March 1748; d. London, 25 Jan. 1829. The son of a singing master, he early studied music and composed anthems that were sung in Durham cathedral. His earliest sustained work was a comic opera, 'The Flitch of Bacon' (1778), and having been appointed composer to Covent Garden (1778-97) he produced several other works, including 'Rosina' (1783); 'The Poor Soldier' (1784); 'The Woodman' (1792); 'Two Faces Under a Hood' (1807). But he is best known by his songs, among which are 'The Heaving of the Lead'; 'The Arethusa'; 'The Thorn'; 'O bring me wine'; 'The Ploughboy'; and 'The Wolf.' The tune of 'Auld Lang Syne,' as now sung, was introduced into his 'Rosina'; the authorship of 'Coming through the Rye' has also been claimed for Shield. Among his literary works are 'An Introduction to Harmony' (1817); and 'Rudiments of Thorough Bass.' In 1817 Shield was appointed 'Master of the King's Musick.' His productions comprise upwards of 30 dramatic pieces, several collections of glees, ballads, trios, etc. He is buried in the south cloister of Westminster Abbey. Consult 'Dictionary of National Biography' (Vol. 52, London 1897); Grove's 'Dictionary of Music' (ib. 1911); Robinson, J., 'Life of William Shield' (Newcastle 1891).

SHIELDS, shēldz, **Charles Woodruff**, American educator: b. New Albany, Ind., 4 April 1825; d. Newport, R. I., 26 Aug. 1904. He was graduated from Princeton in 1844, from the Theological Seminary there in 1847, was ordained in the Presbyterian ministry and served in charge of pastorates at Hempstead, L. I., in 1849-50, and in Philadelphia in 1860-65. He later occupied the chair of harmony of science and revealed religion at Princeton. His publications include 'The Presbyterian Book of Common Prayer according to the Revision of the Westminster Divines' (1864); 'Religion and Science in Relation to Philosophy' (1875); 'The Order of the Sciences' (1882); 'The

United Church of the United States' (1896); 'The Scientific Evidences of Revealed Religion' (1900), etc.

SHIELDS, James, American military officer: b. Dungannon, Ireland, 1810; d. Ottumwa, Iowa, 1 June 1879. He came to the United States in 1826 and entering the army subsequently served through the Mexican War and for bravery in the battles of Cerro Gordo and Chapultepec was brevetted major-general. He was United States senator from Illinois in 1849 and from Minnesota in 1857. During the Civil War he especially distinguished himself by defeating "Stonewall" Jackson at Winchester, 23 March 1862. He was defeated at Port Republic 9 June 1862 and resigned his commission in 1863.

SHIELDS, John Knight, American lawyer, jurist and senator: b. Clinchdale, Tenn., 15 Aug. 1858. He was privately educated and was admitted to the bar in 1879, practising thereafter at Knoxville, Tenn. He became associate justice of the Supreme Court of Tennessee in 1902, and was chief justice of that court in 1910-13. He was elected to the United States Senate in 1913 and was re-elected for the term 1919-25.

SHIELDS, England, the urban aggregation of North and South Shields, two separate municipalities and important seaports in Northumberland and Durham respectively, on opposite banks of the Tyne, near its mouth in the North Sea. The port of Shields, formed by an expansion of the river into a wide bay, has been greatly improved and deepened by dredging and the construction of piers, and accommodates vessels of any size at their quays. There is a very extensive trade, particularly in coal, of which more than 2,500,000 tons were shipped a year before the war.

NORTH SHIELDS, on the north bank of the Tyne, forms part of the municipality and parliamentary borough of Tynemouth (q.v.) together with three small townships. It extends about one mile along the river, and consists of an old and a modern portion, the former with narrow streets and lanes, and the latter with spacious streets and squares. The township extends up the river to Willington, and includes Northumberland Dock and Albert Edward Dock. The chief industrial establishments are shipbuilding yards, saltworks, iron foundries, marine-engine works, and electrical works. Fishing is largely carried on, and much fish is sent to many parts of England. Pop. 59,000.

SOUTH SHIELDS, opposite North Shields, communicates with the latter by steam-ferries. The Saint Hilda coal-mine in the town was opened in 1810. The old part of the town consists of long narrow streets running parallel to the river; but the modern part, immediately behind, occupies a higher site and possesses many handsome buildings. The public institutions include a town hall, police buildings (1893), a custom-house, free library and museum, infirmary, fever hospital, public baths and wash-houses; nautical college, national and other schools and several benevolent endowments. The harbor is lined with ship and boat yards and factories. The chief industries are coal-mining and coal shipments, shipbuilding and ship-repairing, marine-engine and boiler-making, and the manufacture of glass, earthenware, chain-

cables, rope and anchors. Coal is shipped principally at the Tyne docks, area, 50 acres, belonging to the North-Eastern Railway Company. The first lifeboat was built in South Shields and put to sea 30 Jan. 1790. A stone pier a mile long has been constructed at the mouth of the harbor. Pop. 108,647.

SHIELDS. Weapons of defense held before the bearer to protect against blows or projectiles. The shield has been probably universally used by all nations and tribes from that early period when the human being needed an outdoor defense. The early Greeks had their circular shield (*aspis*) of leather or felt, and the *sakos* or oval shield. The ancient descriptions show how these shields were beautified, as the metal one of Achilles made by Hephaistos (according to Homer) with its embossed scenes, that of Heracles in Hesiod's description. Often they had individual badges painted on them (forerunners of the knights' heraldic shields), a custom borrowed from the Persians. The Romans, Diodorus says, at first used square shields, then the *aspis*, and later the large circular iron *clypeus* and the four cornered four-foot-long *scutum*, of wood. Later the light circular *parma* of leather was used by the *velites*. Old Roman bas-reliefs show us also hexagonal shields. The shields of the Gauls (*pavoises*) were so great they crossed rivers in them. The shield of the crusaders was pointed (*heater*-shape). The English buckler and the Scotch targe are old subjects for painters and poets. The shields of the knights or of heraldry are very varied in form changing with the different periods and methods of combat. The "heater" shape was in use in the 12th, 13th and 14th centuries; in the 14th century the sides often ran parallel, the top was still a straight line but the bottom was almost a half round. Then the tilting shields began to appear and indentations were made in the side (termed "bouches") to allow for the passage of the lance, these were very much smaller than the triangular shield of the warrior on foot. But the actual shield of the knight soon passed into the art of heraldry, to be known generally as a *scutcheon*, and assumed fantastic shapes that were never seen in combats; even the distaff (woman) side of the "house" receiving a shield of "lozenge" (diamond) form. A very natural evolution from the decorative shield of heraldry was that to the shield as an accessory in ornament, when it took the place of the *cartouche*. In the decorative arts the shields are endless in form, their decorative curling and curving straps being derived from the metalworkers' beaten cartouches worked up to ornament the gates and doors of the different periods. Perhaps the most extravagantly decorative shield forms are those of the Renaissance, baroque, and rococo periods. Shields have been much utilized as a motif by artists in their decorative "trophy" groupings, and to the present day there is no more favored device in every branch of Art, including architecture, than the shield form.

CLEMENT W. COUMBE,
Technical Art Expert.

SHIITES, shē'its, or **SHIAH**, that sect or party of Mohammedans who assert the rights of Ali (q.v.), the son-in-law of the Prophet, and his descendants to be the true line of

Caliphs, as opposed to the Sunni or Sunnites (q.v.), who uphold the succession of the Caliphs Abu Bekr. The divergence—not unmixed with animosity—that exists between the two sects is similar to that of Protestants and Roman Catholics of former times, and constitutes even to-day the weakest point in the armor of Islam. The Persians and most of the Moslems in India are Shiites, while the Turks and many Arabs adhere mainly to the Sunni faction. The Persians adopted the Shiah doctrines in 1500, since when they have been the national law and religion of that country. Yet neither creed is pure and unadulterated, for each is again subdivided into smaller schisms. (See HASAN and HUSAIN; MOHAMMED; OMMIADS). Consult Muir, W., 'The Life of Mohammed' and 'The Caliphate' (London).

SHIKARPUR, shīk-ār-poor', India, (1) a former district in Sind, Bombay, comprising the four subdivisions of Rohri, Sukkur, Larkana and Mehar. The two first now form the Sukkur district and the other two (since 1901) the district of Larkana. (2) A subdivision of the Sukkur district (see above), composed of the Shikarpur, Naushahro Abro and Sukkur *talukas* or departments. (3) Shikarpur Taluka of Sukkur district, Sind, Bombay, has an area of 492 square miles and a population of about 110,000. It contains one town, Shikarpur (see below) and 88 villages. (4) Town, headquarters of the *taluka* of the same name in Sukkur district, stands in a tract of low-lying country which is annually flooded by canals from the Indus (18 miles west). The soil is rich, producing grain and fruit. Its buildings have been much improved in recent years. There is a famous bazaar with a flourishing trade, owing to the town's position on one of the great routes from Sind to Khorassan *via* the Bolan Pass. There are 17 government schools—one high school, 12 for boys and four for girls (two each for Hindus and Mohammedans), and several private schools (one English). The principal manufactures are carpets and coarse cottons; the more important exports are indigo, metals, henna, spices, groceries, opium, horse-cloths, dry grains and silks. Since the Municipal Act of 1855 great sanitary improvements have been effected. Pop. 53,944, about one-third Mohammedans and the rest Hindus. (5) Shikarpur Taluk, the northern department of Shimoga district, Mysore; area, 429 square miles; pop. about 70,000. The jungle harbors tigers, leopards and other wild animals. The headquarters is also named (6) Shikarpur Town; pop. 5,568. (7) A town in the district of Bulandshahr, United Provinces; pop. about 13,000. The American Methodists maintain a branch mission here.

SHILKA, shīl'kā, a river of Asia, in eastern Siberia, rises among the Yablonoi Mountains and is one of the two rivers (the other is the Argun) which by their union form the Amur, into which it empties at a point beyond Ust Strelka. The Shilka flows from Mount Kentai in the Khan-ula range (Chinese Mongolia) mostly through Russian territory, before reaching which it is known as the Onon. It is about 320 miles long and navigable about one-half of the year. In winter its frozen bed is utilized as a highway. Sretensk is an im-

portant station on the river for vessels going to Khabarovsk. It is a terminus of the Trans-Siberian Railway and the starting point of Russian expeditions to the Lower Amur.

SHILLABER, shīl'a-bēr, Benjamin Penhallow, "MRS. PARTINGTON," American humorist: b. Portsmouth, N. H., 12 July 1814; d. Chelsea, Mass., 25 Nov. 1890. After a brief secondary schooling and training in a local printer's office, he went to Boston, where he followed his trade in several newspaper offices, with the interruption of a year's visit to British Guiana. Then he began journalistic work. Achieving from the first (1847) a great success with his 'Sayings of Mrs. Partington,' whose homely wisdom is closely allied to that of the Widow Bedott. In Boston he was successively an editor of the *Post* and editor-in-chief of the *Carpet-Bag*, a humorous publication of short-lived fame, and of the *Saturday Evening Gazette* (1856-66). Shillaber's work was not, as one critic has phrased it, "trained to move in literary circles," but in that it was similar to most American humor of its period. Among the titles of his books are 'Rhymes with Reason and without' (1852); 'Life and Sayings of Mrs. Partington' (1853); 'Mrs. Partington's Knitting Work' (1857); 'Partingtonian Patchwork' (1872); 'Lines in Pleasant Places' (1875); 'Ike and his friend' (1879); and 'Cruises with Captain Bob' (1880); 'Wideswathe' (1884).

SHILLELAGH, shī-lā'lā, the cudgel of blackthorn or oak carried by the conventional Irishman, with which he is supposed to delight to play on the heads of his friends on occasion. The name is borrowed from the once famous oak forest of Shillelagh in the southwest corner of County Wicklow, 17 miles southwest of Aughrim. There are about 12 ways of spelling this word.

SHILLING, the name of an English silver coin and money of account since the Norman Conquest, of the value of 12 pence, or the 20th part of a sovereign or pound sterling; and equivalent in the United States to about 24½ cents. In the United States, a denomination of money formerly in use, differing in value relatively to the dollar in different States, but below that of the English shilling with a corresponding value for the penny and the pound. An exhaustive history of the shilling may be found in the great Oxford Dictionary of Sir J. A. H. Murray (1888 et seq.).

SHILOH, shī'lō, (1) Palestine, occupied the summit of a high mountain north of Bethel. Its modern name is Seilun. The Ark of the Covenant or Tabernacle (q.v.) rested here from the time of Joshua to that of Eli, when it was carried away by the Philistines. Prior to this Shiloh was the religious seat of the Israelites and a great feast was held annually. The phrase of the Scriptures, "until Shiloh come," has received considerable attention from theologians, and its accepted interpretation is—"until Christ come," or "until rest come." A small village site, 20 miles north of Jerusalem, is identified with the ancient Shiloh. (2) A settlement in Cape Colony, South Africa, in the district of Queenstown, 60 miles northwest by west of King William's Town. (3) There is

one village of this name in Alaska and there are 16 in the United States.

SHILOH, shī'lō (Tenn.), **Battle of**. This engagement, known also as Pittsburgh Landing, was fought 6-7 April 1862, between the Union forces of General Grant, commanding the Army of the Tennessee, and of General Buell, commanding the Army of the Ohio—the latter arriving the night of the first day—and the Confederate Army of the Mississippi under Gen. A. Sidney Johnston, with Gen. P. G. T. Beauregard second in command.

After the battles of Mill Springs and Fort Donelson (q.v.) Johnston withdrew from Kentucky and Tennessee to the line of the Memphis and Charleston Railroad, and soon after concentrated his army at Corinth, Miss. The Union forces were sent up the Tennessee River under Gen. C. F. Smith, Grant having been ordered by General Halleck to remain at Fort Henry (q.v.), Gen. W. T. Sherman, commanding the advance and seeking to cut the railroad, finding the country above Pittsburgh Landing under water, fell back to that point, and recommended its occupation to General Smith, who had remained at Savannah. Sherman established his division 19 March at Shiloh Church, about two and a half miles back from the Landing, General Hurlbut's division having been encamped one mile out from the river. Grant, having been restored to command, reached Savannah 17 March and sent McClelland's and C. F. Smith's division under W. H. L. Wallace to Pittsburgh. Prentiss' division followed later. Little or no attention was paid to lines of battle or reserves, both Grant and Sherman looking upon the concentration as preparatory to an advance upon Corinth. Gen. Lew Wallace's division was established at Crump's Landing, some six miles below, where, as Grant explained to Halleck, he had a good road which would enable him "to form a junction with the main column, . . . six or seven miles before reaching Corinth."

In regard to this move, Halleck, 20 March, telegraphed: "By all means keep your forces together until you connect with General Buell, and wait till you are properly fortified and receive orders." No attention was paid to this direction as to fortifying, and neither abatis nor rifle-pits were constructed, nor timber felled. Grant in his 'Memoirs' says of this, "When all reinforcements should have arrived I expected to take the initiative by marching on Corinth, and had no expectation of needing fortifications, though this subject was taken into consideration." The further reason given by Grant was that the proper line for fortifying was in rear of the camps as they ran, and could not be easily supplied with water. Sherman, in his 'Memoirs,' writes: "We did not fortify our camps against an attack, because we had no orders to do so, and because such a course would have made our raw men timid"; and in a court-martial case he testified: "To have erected fortifications would have been an evidence of weakness, and would have invited an attack." There was no expectation of an attack. Grant, in his 'Memoirs,' says: "The fact is, I regarded the campaign we were engaged in as an offensive one, and had no idea that the enemy would leave strong intrenchments to take the initiative when he knew he would be attacked where he was if he remained."

General Nelson, the advance of Buell on the march from Columbia, telegraphed Grant on 3 April that he could be at Savannah 5 April, and in reply was informed Friday, 4 April, that he need not hurry, as boats could not be ready to take him to Pittsburgh until the 8th. The same day Grant notified General Prentiss: "The review of your division will not take place until Tuesday next." Two days before the time fixed for review Prentiss and his division were prisoners in the hands of the enemy. This conviction that there would be no attack led not only to neglecting all defensive preparations, but to selecting camp-grounds without regard to a line of battle and chiefly with reference to available ground and the convenience of water. Three of Sherman's brigades were established about Shiloh Church and the fourth two miles distant. This wide space was later filled in part by Prentiss' division, leaving extensive gaps on each of his flanks. According to maps of both Grant and Sherman, McClelland's division was camped to the left and rear of Sherman, and nearly at right angles to the latter, with its flank toward the enemy's position. Hurlbut's division was a mile in rear of Prentiss, and W. H. L. Wallace's about the same in rear of Sherman.

There had been a considerable show of Confederate cavalry several miles to the front 4 April, but on the 5th Sherman wrote Grant: "All is quiet along my lines now. We are in the act of exchanging cavalry according to your order. The enemy has cavalry in our front, and I think there are two regiments and one battery six miles out." The same day one of his regiments had been engaged under his orders in cutting a road and bridging a creek in his front for the advance on Corinth. Later in the day Sherman wrote Grant: "I have no doubt that nothing will occur to-day more than some picket-firing," and that he did not "apprehend anything like an attack" on his position. The same day, after Sherman's report from the front, Grant, who had gone back to Savannah for the night, telegraphed Halleck: "I have scarcely the faintest idea of an attack (general one) being made upon us, but will be prepared should such a thing take place. General Nelson's division has arrived. The other two of General Buell's column will arrive to-morrow and next day. It is my present intention to send them to Hamburg, some four miles above Pittsburgh, when they all get here. From that point to Corinth the road is good, and a junction can be formed with the troops from Pittsburgh at almost any point." Grant, the same day, telegraphed Buell: "The enemy at and near Corinth are probably from 60,000 to 80,000."

At the very time of these various interchanges of opinion Hardee's corps was in line of battle within a mile and a half of Sherman's headquarters, having deployed in this position at 10 A.M., 5 April, with General Bragg's corps forming as a second line, and Polk's and Breckinridge's corps, the rear of Johnston's army, closing up. The Confederate army had marched from Corinth the morning of 3 April, expecting to attack Saturday morning, the 5th, but a heavy storm and other causes delayed so that the attack was postponed till Sunday morning, the 6th. Such was the situation Saturday night in the Union camps. While there was a very general feeling among the pickets and

many subordinate officers that the enemy was near in considerable force, it was discredited by Sherman, and so the usual precautionary orders were not given to medical, ordnance, quartermaster, or commissary officers, or to the troops, and no one had any official intimation that a battle was impending, or knew that Johnston's entire army was close to their front awaiting daylight to attack. There had been some strengthening of pickets, but nothing was done which even the suspected presence of the Confederate army would have called for.

General Prentiss, after the war, in the first public utterance on the question of surprise, said: "In reference to the still general inquiry, 'Was our army surprised at Shiloh?' I can only reply for myself that I had not the slightest idea that a general engagement was to be fought that day." He said further: "We were not prepared on the 6th of April"; but "admonished by the action of the enemy on Friday evening," he had strengthened his pickets.

Gen. Andrew Hickenlooper, now one of the principal officers of the Society of the Army of the Tennessee, an officer of note in Grant's army throughout the war, and a strong friend of Grant and Sherman ever after, commanded a battery in Prentiss' division at Shiloh. In the course of an exhaustive review of the battle he says of the general situation: "There had been no order or system in camping; no relation of one command to another; no defined front or known rear, except an impassable river. There was no common directing head or superior officer beyond the rank of division commander placed on the firing line, whom all would recognize and promptly obey." . . . "The night before had been passed by the Union troops in merry-making until the camp sank into a peaceful slumber, from which they were aroused by the roar of musketry and the booming of the guns of the Fifth Battery." As to the early hours of the day of battle, he observes: "The bugle's cheery notes aroused the camp at the dawn of day; breakfast was over, and all was ready for an early morning drill, when the faint reports of distant picket-shots were heard and then came the pattering fire of the reserves, . . . followed by volleys on the right that told of swiftly approaching danger." The pickets of Prentiss were the first to encounter the Confederate advance, and being strongly reinforced, they attacked Hardee's oncoming line. The latter pushed rapidly forward and thrust strong flanking forces into the wide gaps on Prentiss' flanks, thus turning both, as well as Sherman's left, and the right of Stuart—Sherman's isolated brigade.

Sherman's brigades formed on their color-line, a portion of the troops being called from their breakfast for the purpose. They advanced between 200 and 300 yards, met the enemy in force and checked his advance for a time, Sherman meantime sending to McClernand for a battalion of cavalry to join one of his "for the purpose of discovering the strength and design of the enemy." It was not until 8 o'clock, however, that Sherman became convinced that it was an attack in force. He thus fixes the time in his official report: "About 8 A.M. I saw the glistening bayonets of heavy masses of infantry to our left front in the woods beyond the small stream alluded to, and became satisfied for the first time that the enemy de-

signed a determined attack on our whole camp." At 10 o'clock most of the advanced Union camps were in the hands of the enemy. There had been no time to strike tents or remove stores or private baggage. Sherman relates that two of his horses were killed at the picket-ropes, and that he found them still tied there when the camps were recovered the next day.

In spite of this general surprise and of the tremendous onslaught of solidly formed battle-lines, there was throughout the day much stubborn and even remarkable fighting, in which Sherman, Prentiss, McClernand and Hurlbut were personally conspicuous. After the battle began, Sherman's conduct was beyond praise. There were probably 20,000 men in regiments that maintained their shattered organizations, and in broken groups, in batteries, and in mixed forces rallied by brave officers and men, which, together, without special regard to lines, held with desperate courage against the enveloping enemy. Many of them were killed or wounded before the day ended. But nothing could permanently resist the well-ordered Confederate movement. Grant wrote that when he met Buell at the Landing, which was at 1 P.M., "there probably were as many as four or five thousand stragglers lying under cover of the river bluff, panic-stricken, most of whom would have been shot where they lay, without resistance, before they would have taken muskets and marched to the front to protect themselves."

As the day advanced, the Union line was fast disintegrating. Sherman, testifying under oath at a subsequent trial, said that "at least 10,000 ran away." Prentiss' division was surrendered and captured soon after 5 P.M., having fought and maintained its organization to the last, and given the best illustration of pluck, endurance, and persistence in fighting that the history of the first day affords. Sherman's organization was destroyed, and he, with a small force of his own, was fighting stubbornly with McClernand, whose organization, though much broken, was still maintained. About 2 P.M. Johnston was wounded, and died in half an hour. The transfer of command to General Beauregard caused a lull in the fight, and a delay in movement, but at 5 the Union line had been forced back into a corner between the Tennessee River and Snake Creek, an area which included the landing. Here the line presented a front of about a mile and a half to the enemy. Just as an assault on this position was being delivered at the right of the Confederate lines, Ammen's brigade of Nelson's division of Buell's army, which had marched from Savannah through the swamps, was ferried across the river, and two regiments advanced and opened fire upon the right regiments of the enemy, which, in charging forward, had nearly reached the landing. The assault was checked without severe fighting, but the arrival of fresh troops thus became known, and the Confederate attack ended for the day. At this time Grant's line in front of the landing was held by the broken organization of Hurlbut, W. H. L. Wallace, McClernand and Sherman. There were portions of various organizations available within the protected area, and Lew Wallace arrived during the night with 5,000 men. Buell himself had arrived at 1 P.M., and spent the afternoon in learning conditions and studying the ground, and the night in

posting his troops. Nelson's division was ferried over at night, and advanced on the left; Crittenden's, as the steamers brought it from Savannah, was placed on Nelson's right. Two brigades of McCook's division, which followed Crittenden up the river, were established still further to the right. The Union gunboats *Tyler* and *Lexington* anchored off the ravine next above the landing, and near the close of the first day's fight, fired effectively upon the Confederate right flank and front, as the Union line was forced back toward the river. These boats continued their heavy shelling at intervals during the night, to the great discomfiture of the Confederate camps.

The battle of Monday, 7th, was opened under Buell's orders and direction. His left and centre advanced and became engaged with the enemy's pickets immediately after daylight, and encountered their main line at 6 A.M. McCook's two brigades moved at once into action, and were established still further to the right. The Army of the Ohio pressed steadily forward, and at 4 P.M. had possession of the camps of Stuart, Prentiss and a part of McClernand's. Two brigades of T. J. Wood's division arrived as the battle was ending, but only one reached the front. The action closed soon after 4, Buell's forces at that time covering two miles of the battle line (nearly three quarters of it, extending as it did to the left of Lew Wallace's division), and becoming hotly engaged there, in co-operation with Wallace's left regiment. Wallace, at the close of the battle, held the front of the Army of the Tennessee, McClernand, Sherman and Hurlbut being warmly engaged at the close in connection with the left of Wallace, and the right of McCook. About 5 P.M. the Army of the Tennessee reoccupied its former camps.

When Buell first advanced he was joined by Col. J. M. Tuttle of W. H. L. Wallace's second division, who gathered up about 1,000 men of his own command, rallied many more from fragments about his bivouac, and without orders proceeded to Buell's lines, reported to him, and fought with him through the day. At daylight Grant gave Sherman orders to advance on the right. He thereupon sent his staff officers to collect his men and moved forward about 7 A.M. At 9 o'clock Hurlbut moved under Grant's orders to support McClernand, who with Sherman, was then engaged near his former camp. Lew Wallace had advanced earlier and held the right of Grant's army. This division finally swung around upon the ground originally occupied by Sherman's camps, there coming in contact with the right of McCook of Buell's line. Here the battle ended.

The division commanders of Grant's army were J. A. McClernand, W. H. L. Wallace, Lew Wallace, S. A. Hurlbut, W. T. Sherman, and B. M. Prentiss. Buell's divisions on the field were A. McD. McCook, William Nelson, Thomas L. Crittenden and T. J. Wood. The division commanders of Johnston's army were: of Polk's corps, C. Clark and B. F. Cheatham; of Bragg's corps, D. Ruggles and J. M. Withers; of Hardee's corps, T. C. Hindman, P. R. Cleburne and S. A. M. Wood; reserve corps, J. C. Breckinridge. The best estimates of strength give Grant 33,000 at the opening of the battle, and Lew Wallace's reinforcement for the second day 5,000. The official reports give John-

ston's strength at 39,000 to 40,000. The losses of Grant's army were 1,513 killed, 6,601 wounded and 2,830 missing; total, 10,944. Buell lost 241 killed, 1,807 wounded and 55 missing; total, 2,103. Total Union loss, 13,047. The Confederate loss was 1,723 killed, 8,012 wounded and 959 missing; total, 10,694. Obreiter) and 'The Battle of Shiloh' (D. W. Reed, Harrisburg 1905); Rich, J. W., 'The Battle of Shiloh' (Iowa City 1911). See also *Bibliography* under CIVIL WAR IN AMERICA.

H. V. BOYNTON,
Late General, U. S. Army.

SHIMODA, shē'mō-dā, or **SIMODA**, Japan, a seaport town on the island of Hondo, at the western entrance of the Gulf of Yeddo, 80 miles southwest of Tokio. It was nearly destroyed by an earthquake and tidal wave in 1854, but was rebuilt, and since 1857, when the Dutch treaty was signed, it has been a free port for foreign commerce. A daily steamer service runs between this port and Tokio in summer. Pop. 5,000.

SHIMONOSEKI, and **MOJI**, shē-mo-no-sēk'ē, mō'jē, the former originally called Akamagaseki, now popularly known as Bakan: a fortified town, seaport and railway terminus of Japan, at the southwestern extremity of Honshu (the Main Island), situated in 130° 56' E. long., 33° 57' 30" N. lat. on the northern coast of the Shimonoseki Straits. Together with Moji, on the opposite coast, the town holds the key of the western gateway of the Inland Sea. The town extends four miles from east to west and has extensive docks where much Japanese and foreign shipping is cleared, though its trade is not so large as that of Moji. Shimonoseki is famous in Japanese history for the sea-fight in 1185, by which the Taira Clan was exterminated by the Minamoto Clan. Here also took place a bombardment of the forts, 5-8 Sept. 1864, by a united squadron of American, British, French and Dutch warships, which landed marines and seized the batteries. The situation arose through the action of the Daimyo of Chōshū (in whose territory the town lay), in attempting to keep foreigners away by repeatedly firing on foreign ships that passed his batteries on the coast. The American steamer *Pembroke* was fired upon 25 June 1863; on 16 July United States steamship *Wyoming* destroyed two vessels and attacked the batteries in retaliation. When the combined squadrons (17 vessels) of the four powers brought the Daimyo to terms, the latter agreed to abstain from future hostilities, and thenceforth to supply foreigners with provisions. The Shogun (Commander-in-chief, a feudal office abolished in 1868) was obliged to pay an indemnity of \$3,000,000, of which amount the United States received \$785,000. The American government returned this sum to Japan in 1883, but without interest. After the Restoration in 1868 Shimonoseki rose in prosperity owing to its geographical situation. The treaty of peace which ended the Chino-Japanese War of 1894 was signed

here 17 April 1895 (ratified 8 May) by Marquis Ito, Japanese premier, and Li Hung Chang for China. Pop. 58,300.

Moji is usually coupled with Shimonoseki as their interests in shipping are indential. The latter is under the jurisdiction of Yamaguchi, 51 miles away; Moji under that of Fukuoka, 47 miles away. The foreign merchants and shipping agents have their offices on the side best suited to their convenience, but the principal Japanese banks and shipping offices are at Moji. That town became important in 1887 when the Kyūshū Railway made it the terminal. It is entirely open to general foreign trade. Pop. about 56,000.

SHIN-PLASTER, a bank-note, especially one of a low denomination; a piece of paper money. The term is derived from an old soldier having used a quantity of worthless paper currency as plasters for a wounded leg. See MONEY, PAPER.

SHINER, one of various small silvery fishes of the family *Cyprinidae*, found in all streams from New England to Kansas and Louisiana, especially in those choked with weeds. They are the object of childish angling expeditions, and sometimes are large enough to be cooked, but should be eaten at once, as the flesh spoils quickly. (See DACE; MINNOW). The moon-fish (*Vomer setipennis*) is sometimes called blunt-nosed shiner.

SHINGLE. A shingle is a flat, tapered piece of wood used as a roof covering or for the siding of houses and bungalows. Dating back to the earliest American settlements, the wooden shingle has been used as a roof covering, and only in comparatively recent years has any other roofing material been used by the people of the United States and Canada. Until the latter part of the 19th century the shingles were cut from the nearest woods at hand that best answered the purpose. The earliest settlers on the Atlantic Coast used principally the wood of the White Pine and the Virginia Cedar. As they were made by hand, such woods were selected as possessed a straight grain, split easily and possessed a considerable degree of durability. In the southern part of United States, Cypress is largely used for shingles.

The rapid development of the United States, however, called for large quantities of wood for other construction purposes, and gradually the supply of woods suitable for the manufacture of shingles became exhausted to such a point that woods of more abundant supply were sought. On the Northwest Pacific Coast was found the Western Red Cedar in practically inexhaustible supply, and it was discovered that this species had been used on the Pacific Coast for shingles since the time of the earliest settlements there.

Development of transcontinental railroads made available shingles sawn from this species over almost the whole of North America and to-day 85 per cent of the shingles manufactured are sawn from this wood. Due to its large use in the manufacture of shingles, Western Red Cedar (*Thuja plicata*) is also commercially known as "shingle wood."

At the present time, California Redwood, Southern Cypress, Eastern White Cedar and the Western Red Cedar constitute about 99 per

cent of the supply for wooden shingles, but the latter is by far the best known, and most widely used.

On the warm moist slope of the Cascade Mountain Range in Washington, Oregon and the Province of British Columbia, the Western Red Cedar tree is found in great abundance, and in this locality it attains its maximum growth and size. Trees of from 12 to 16 feet in diameter, measured $4\frac{1}{2}$ feet from the ground, are not uncommon. Under average growing conditions, when this tree is mature it will have a clear bole of from 50 to 100 feet. No other American wood is better adapted to the requirements of a wooden shingle than Western Red Cedar. The supply is sufficient to meet all demand. It is durable in the extreme. It is quite easily worked. It has an extremely straight-grain. It is light in weight. It has an oil peculiar to this wood alone that renders it quite immune from the ravages of fungi and insects.

The timber is removed from the woods in either log or "bolt" form. At the shingle mill the timber is cut into the length of shingle desired and is then usually barked and cut into blocks small enough to be handled with ease. The resulting blocks are then placed in a shingle machine, which automatically cuts off the tapered shingles. Any defects are then trimmed off and the shingles cut into the most desirable widths. The shingles are then dropped into large bins, from which they are packed. To expedite seasoning and to reduce the weight for transportation purposes, after packing the shingles are put through a dry kiln, where they are dried for from 7 to 10 days, at the end of which time they are ready for shipment.

Cedar shingles are cut in two standard lengths, 16 and 18 inches. Each lengthed shingle is packed in two standard thicknesses. For the 16-inch shingles, these thicknesses are five-to-two and six-to-two, meaning five shingles at their butts will measure two inches, and six shingles at their butts will measure two inches, respectively. For the 18-inch shingles, these thicknesses are five-to-two-and-one-quarter and five to two. The most common grades for the 16-inch shingles are "Extra Clear" and "Extra Star-A-Star"; for the 18-inch shingles "Perfections" and "Eurekas."

There are many striking examples of long life peculiar to the roofs of homes covered with Red Cedar shingles. "Lowland," the magnificent mansion of the late George Abbot James, at Nahant, Mass., was built and roofed with Red Cedar shingles in 1872 and is found to be in perfect state of preservation. The old Block House built at Fort Borst in 1845 was roofed with Red Cedar "shakes" (split shingles) and is still in an excellent state of preservation. Many of the pioneer homes of the Northwest that were covered with Red Cedar shingles are yet in service.

Logs of Western Red Cedar have been frequently found in the forests of the Pacific Northwest, over which trees have grown, that have been found by counting their annual growth rings to be over 800 years old. In every instance the logs have been found to be in a perfect state of preservation.

Due to the abundance of timber supply, and the comparatively small amount of capital neces-

sary to finance the manufacture of shingles, there have been a very large number of shingle mills constructed. It has been estimated that in excess of 400 shingle mills were in operation in 1908. This has constituted an over capacity, which has been a very material factor in causing a depressed condition in the shingle industry, but a gradual evolution of the timber into fewer hands, the construction of fewer mills, but of larger capacity, is resulting in a stabilization of the shingle industry and the placing of this industry upon a sound economic basis, and the making possible of guaranteed quality.

SHINGLES, an acute disease (*herpes zoster*) characterized by an eruption of vesicles on an inflamed surface of skin. The name is derivatively related to *cingle*, a belt or girdle. Shingles occurs most frequently in children and young adults between the ages of 4 and 20. In children it is more liable to appear during or after other diseases, such as whooping-cough and diarrhoea. In adults various debilitating causes seem to predispose to its attack, especially paralysis of the insane, cerebro-spinal meningitis and the arsenic habit. The actual causation of the disease is unknown. The eruption consists of red spots and small vesicles which are mostly disposed round one side of the body, like a half belt. In rare cases it encircles the body. It has an obscurely nervous character, occurs in the course of a nerve, and is preceded by stinging neuralgic pains, also by languor, lassitude, loss of appetite, shiverings, headache, nausea, quickened pulse, etc., after which the eruption appears in irregular patches. The vesicles become enlarged to the size of small pearls in 24 to 36 hours, and fresh clusters occur for three or four days, completing the belt-like appearance. As the eruption recedes by the fifth or sixth day, the vesicles become white and opaque, and the red margins become livid or purple. Sometimes the vesicles burst, and several of the patches run together, forming irritable sores, discharging a thin serous fluid, which concretes and forms a crust, that falls off as the parts beneath heal. The disease is not contagious. It may be produced by sudden exposure to cold after violent exercise, and sometimes follows acute affections of the respiratory organs. A similar eruption may appear on the lips and chin in a common cold. No known remedy given internally has a specific beneficial effect in shingles. The treatment consists in gentle laxatives, and in rectifying any derangement of the system; but the disease must be allowed to run its course, although the irritation can be diminished by local application. In the severer forms sulphur ointment is recommended.

SHINN, Everett, American artist: b. Woodstown, N. J., 6 Nov. 1873. He studied at the Philadelphia Academy of Fine Arts and in Paris. He is known for his pastels and mural decorations, and as a magazine illustrator. He painted the mural decorations at the Belasco and Stuyvesant theatres, New York, and at Trenton City Hall.

SHINN, Florence Scovel, American illustrator, wife of E. Shinn (q.v.), to whom she was married in 1898: b. Camden, N. J., late 19th century. She studied at the Pennsylvania Academy of Fine Arts, and became well known

for her book illustrations, which include 'Mrs. Wiggs of the Cabbage Patch,' 'Lovey Mary,' and 'Coniston.'

SHINNECOCK, shīn'ě-kōk, a bay on the south shore of Long Island (q.v.). It indents Suffolk county for about 12 miles, and at the entrance is a long, narrow sand-bar. Nearby is the land owned by the Shinnecock Indians.

SHINNECOCK INDIANS, an Algonquian tribe of Long Island, N. Y., formerly occupying the southern coast from Shinnecock Bay to Montauk peninsula. Many of them early joined the Brotherton Indians, and the 143 that remain (1919) on their reservation of about 400 acres, three miles west of Southampton, have intermarried with negroes until their aboriginal character has been almost obliterated. (See INDIANS, AMERICAN). Consult Hodge, F. W. (ed.), 'Handbook of American Indians' (2 vols., Government Printing Office, Washington 1907-10).

SHINTO (spirit-way), the primitive folk-faith of the Japanese, was a typical barbarian religion composed of nature-worship and ancestor- (including hero) worship. Chinese culture, filtering into Japan through Korea, brought with it Confucianism about the 4th century A.D., and Buddhism in the 6th; and these two made with Shinto a religious compound in Japan similar to that which they made with Taoism (see TAOISM) in China, except that Shinto was nearly absorbed by Buddhism, until its resuscitation, from the 18th century onwards. This culminated in its reinstatement in pure form as state religion at the Japanese revolution in 1868, only, however, some years later to be disestablished and declared not a religion, but a state ceremony. Under the influence of modern education, its cult is rapidly declining. This immigrant Chinese culture also made possible commitment to writing of the Shinto myths and legends, 712 A.D., into the Kojiki, "Ancient Records," and of the Shinto rituals, 927 A.D., into the Yengishiki, "Ceremonial Law"; recording their barbarian traits in a naive, unexpurgated form which aptly exemplifies the rise of religion in both creed and cult.

The Japanese theory of origins begins its myths with Izanagi, "Male who Invites," and Izanami, "Female who Invites," a primitive pair that still survive in popular belief. Their begetting of the various islands of Japan—which, as the commentators of old Japan used to explain, have since grown enormously—was performed with the aid of phallic rites (see PHALICISM) which persisted in Japan until the revolution in 1868. After the decease of his sister-wife, Izanagi produced several deities in various magical ways, and especially three great deities: Amaterasu (Sun) from his left eye, Tsuki-Yomi (Moon) from his right eye, and Susano (Storm-cloud) from his nose, with obvious implication of Izanagi as creative Heaven. Amaterasu-O-Mi-Kami, "Heaven Shines Great August Deity," has always stood supreme, as sun goddess, among the myriad deities of Shinto, and is still worshipped at innumerable shrines throughout Japan. Susano, "Impetuous Male," represents the storm-cloud, now in turbulent strife with his gentle sister, Amaterasu, now quelling destructive fires for man. His rule over Izumo province descends

through six generations to O-Kuni-Nushi, a moon-god who with his son, Koto-Shiro-Nushi, are now popular as gods of wealth, under the names of Daikoku and Ebisu. The former is seated on rice bales, the latter holds a fish, these being the staple foods in Japan.

In accordance with the evolution of religion, the Kojiki now passes from the origin of its gods in myth to the origin of its rulers and priests in legend, and of course secures authority for the latter by derivation of them from the former. Thus the Kojiki relates how Amaterasu produced by magic a son, Ho-Mimi, whose begotten son, Ninigi, at her command, descended from Heaven with a retinue of nobles and priests, deposed O-Kuni-Nushi, and founded that Imperial Dynasty which still after two millennia rules in Japan, "in lineal succession unbroken for ages eternal." The Imperial Oath, prefaced to the Constitution of Japan, promulgated in 1890, appeals to the "Imperial Founder of our House," namely, Jimmu Tenno, great-grandson of Ninigi, who was in turn supposititious "sovereign grandchild" of Amaterasu-O-Mi-Kami. The "Heaven" from which Ninigi, with his nobles and priests, really descended was Korea, as the Kojiki naively implies and as certain monuments show.

After his abdication and death, O-Kuni-Nushi became (according to his Kyushu conqueror) as "Great Deity of Miwa," ruler of the "invisible," by which was meant the world of thought and secret action which escapes the notice of the earthly ruler. The tutelary gods of every province must report at O-Kuni-Nushi's shrine in Izumo every October (hence called everywhere except in Izumo the "godless month") upon the condition of each individual's soul. O-Kuni-Nushi then punishes or rewards by means of the natural good and evil that befall men. Later he became a ruler of the dead. The mythical element in the Kojiki now decreases and legend passes into annals which close in the 5th century A.D.

The ancestor and hero worship of Shinto was absorbed by Buddhism, since the latter professed especial knowledge about the future life; though each district managed to retain an Ujigami, Clan god, to whom infants were presented for adoption and naming. Hero worship is maintained mostly in these Ryobu, "Two Faced," shrines. Such were Tenjin-Sama, "Heaven Spirit Lord," originally the minister of state and scholar, Michizane of the 10th century A.D.; Hachiman San, an apotheosis of the Emperor Ojin of the 4th century A.D., as God of War; Ieyasu and Iyemitsu, 17th century shoguns of Japan, with gorgeous temples at Nikko; and Motoori, a patriotic scholar apotheosized during the last reign. Until the revolution in 1868 two *living* persons were regularly treated as divine; the Mikado still styled Tenshi Sama, "Heaven Son Lord," descendant of Amaterasu-O-Mi-Kami; and the highpriest of the Izumo O Yashiro, being the 76th generation from O-Kuni-Nushi, and until 1868 styled Iki-gami, "Living-god."

The Yengishiki, "Ceremonial Law," compiled 927 A.D., from much older sources, is a worthy companion to the Kojiki. It contains 27 rituals, which consist, not of free petitions, but of statements of the *grounds* upon which the offerings, which are the essential thing, are made, namely the reception of some natural

good. The famous Obarsu, performed for the whole nation 30 June and 31 December, affords a single exception to this quest for natural good. The Kagura is a popular occasional ceremony, a peace offering of food, music and dancing made to any deity by the temple attendants—usually the daughters of the resident priest—at the request and expense of any worshipper. The priests marry, their office is hereditary, but may at any time be abandoned, and distinctive dress is worn only when they are officiating. They make no claims to personal sanctity or authority.

The infrequent preaching of the priests always appeals to the examples of the gods, and for positive rules to the laws of that Tenshi Sama who rules by divine right. As for the rest of conduct, "Human beings, having been produced by the spirit of the two Creative Deities, are naturally endowed with knowledge of what they ought to do and what they ought to refrain from. It is unnecessary for them to trouble their heads with systems of morality."—N. Matoori. The Kurozumi, a sect founded a century ago, and now having about a million adherents, practises mental healing by various rites, and by accord with two commandments: Thou shalt not be without a constantly believing heart. Thou shalt not yield to anger nor grief.

EDMUND BUCKLEY.

SHIP. A ship is a large boat, or vessel, intended for navigating the ocean. Technically a ship is a vessel carrying not fewer than three masts rigged with square sails. In the present day ships are of two kinds, sail and steam. For a history of the former see the article SAILING VESSELS, and for a historical sketch of steamships, see the article STEAM VESSELS. A detailed description of vessels used in naval warfare will be found under the title WARSHIPS.

A ship has three principal dimensions: length, beam and depth. Length is the straight-line horizontal distance from bow to stern. It is officially measured on the upper side of the upper deck of vessels having less than three decks, and on the second deck above the keel on all other ships; the beginning point being the inside of the inner plank at the side of the stem and reaching to the inside of the planking at the midship stern timber; deducting the amount of rake of the stern timber in the thickness of the deck, and one-third of the fore-and-aft round into the beam. The "beam" is the horizontal distance amidships taken at right angles to the length. Officially it is measured from inside to inside of the planking on the under side of the measurement deck. The depth is the vertical distance from the under side of the beams of the deck of measurement to the keelson. That part of the depth of a ship below the water-level is called the draught; that part above the water-level is termed the freeboard. The draught and freeboard vary according to the weight of cargo

carried, the draught being more and the free-board less when the weight is greater.

The principal requirements of a ship are buoyancy, stability, strength, capacity and speed. The buoyancy of a vessel depends upon its ability to displace a greater weight of water than the weight of the materials of which it is built. The weight of water (in tons) thus displaced is called the displacement of the ship; and as salt water is heavier bulk for bulk than fresh water, with the same load a ship will ride higher in salt water than in fresh. The centre of buoyancy is equivalent to the centre of gravity of the mass of water displaced by the ship. When the ship is at rest in placid water it is located at a point in the vertical line passing through the centre of gravity of the ship. It is the point at which the pressure of the water in which the ship floats is theoretically centred—as the *force* of buoyancy. This force, however, acts not at the centre of buoyancy, but vertically upward through that centre. As the ship rolls under the action of waves or of wind the centre of buoyancy shifts. In Fig. 1, the continuous lines show a sectional diagram

FIG. 1.

(amidships) of the vessel at rest in placid water: the dotted lines show the vessel heeled over by wind and wave. The centre of buoyancy has swung from B to B'; the centre of gravity moves to G'. XB' shows the position of the force of buoyancy, and G'Z the force moving to right the ship to an even keel. Stability is that quality of a ship by virtue of which it resists overturning. The nearer the centre of gravity of the ship can be brought down (in the loading) to the centre of buoyancy, the more stable the ship—that is, the greater the force which must be applied to raise the centre of buoyancy above the centre of gravity and cause an overthrow. In other words the stability of a ship depends upon the relative positions of the centre of gravity and the centre of buoyancy. The centre of gravity is discovered by a calculation of the various weights making up the ship's total displacement. A similar series of calculations based on the form, or proposed form of the ship will determine the position of the centre of buoyancy. A graphic method of arriving at the same result consists of cutting from cardboard a series of cross-sections of the ship drawn to scale and gluing them together with their centre lines and load-water lines matching as in Fig.

2. Several groups of these cross-sections are made, one for each angle of rolling. Equidistant parallel lines are drawn across each model, representing the position of the vessel with different loadings. The divisions are cut

FIG. 2.

off in succession from the top line, and the remainder after each cutting is carefully weighed and recorded for purposes of comparison. Before each cutting the combination of cross-sections is suspended from a nail, allowing it to hang freely, and a plumb-line hung from the same point of support. The model is hung first from one corner and then from the other—as shown in Fig. 3, where PL represents the plumb-line in the first suspension, and its trace in the second suspension, QR the position of the plumb-line in the second suspension, and B the centre of buoyancy found by their intersection. From B a line is projected vertically upward—that is at right angles to the waterline to which the ship is assumed to roll. The extension of that line until it meets the centre line GK of the ship's molded form gives the point M, known as the metacentre. In discussing the principles of flotation, the ship is often considered a pendulum whose point of suspension is at the metacentre. The higher this point is above the centre of gravity (G), the more stable the ship. As M is made by the molding or the loading to approach G, stability diminishes, and when M passes below G the equilibrium is unstable, and overturning is imminent. The horizontal distance (GZ) from

FIG. 3.

the centre of gravity to the vertical line passing through the centre of buoyancy and the metacentre represents the force operating to right the vessel; that is, when the lines of the model are drawn to a standard scale.

Finding the centre of gravity is a much more complicated process. The necessary calculations are too extended to be reproduced here and the reader is referred to technical works on shipbuilding for intensive study of the problem. A mechanical method is often employed and when extreme care is exercised the results are sufficiently accurate to serve every practical purpose. The "light" ship—that is, with all its stores and equipment on board, but without cargo—is subjected to what is known as the "inclining experiment." The ship is heeled over from an upright position by the moving of a weight from one side to the other. The trial must be made in perfectly calm weather, in placid water, and the weight should be large enough to roll the vessel through an arc of at least two degrees. For a large liner, say of 70 feet beam, a weight of 10 tons is required. Pig iron is commonly used. A long plumb-line is suspended inside of the ship and its deflections marked. The metacentre having been previously determined by the finding of the centre of buoyancy, the remainder is easy.

Trim, as applied to a ship, is allied to its stability. The term signifies the condition of draught as related to its length. For example, if the draught forward is one foot less than the draught aft, the vessel is said to have a trim of one foot by the stern. A trim by the head would mean that the draught forward was the deeper.

Strength of structure is necessary to withstand the strains to which the ship is subjected by wind and waves. In order to calculate these strains the vessel is regarded as a girder supporting the various weights of cargo, engines, coal, etc., acting downward; and also acted upon by the lifting strain of buoyancy acting upward. This girder is studied in two situations: First, as lying across the trough between two waves, supported at each end by deep water with its large lifting strain and by shallow water with very little supporting power at the middle: this is called the "sagging" strain. The other critical position is that where the middle of the ship's length is supported by the deep water of the crest of a wave and both ends are in shallow water: this is called the "hogging" strain. These two conditions are illustrated at A and B respectively in Fig. 4. The strength of the ship proper

FIG. 4.

is thus quite distinct in meaning from the local strength of various parts designed for certain purposes, as for the distribution of the weight of the engines, the thrust of the propeller, the supports for hoisting cranes, and the like.

The capacity of a ship is her power of carrying stores and cargo, together with crew and passengers. The greater this capacity is in pro-

portion to the size, and the greater the speed of the vessel, the greater is her utility. The more lightly a vessel is built the greater will be her capacity for her size; but the lightness of a vessel is limited by the need of strength to resist strain. Capacity is also to some extent dependent on form, and the form which is most conducive to high speed is not necessarily that which gives the greatest capacity for stowage. The speed of a vessel, as also facility of evolution or promptitude in obeying her helm, depends on the due proportion of her parts. Given an equal engine power, the speed of a vessel is dependent upon its underwater outlines. In a general way it may be said that the sharper the bows the more easily the resistance of the water is overcome; and long, gentle, horizontal curves are speedier than a straight, chisel-shaped form. Bevelling-up the bows from the keel to the deck tends to an increase of speed in two ways: it lowers the initial resistance of the water and causes a tendency of the bow to rise and ride upon the water, thereby diminishing the draught. Bevelling-up the stern is also of advantage, provided the tapering of the body of the ship does not begin too far forward. If begun at the midship section and curved in gently running lines aft, the speed will be increased. A similar result will be secured by curving the bottom of the ship gently upward from amidships toward the stern. The midship cross-section whose water surface most nearly approaches the semi-circle is the speediest. However, on account of its lack of stability and the very objectionable tendency to roll, it is used only when speed is the chief consideration. Figure 5 shows in diagram-

FIG. 5.

matic form the shape and water-line found to be speediest under any given propulsion, the length being from 7 to 10 times the beam. It is common in swift river steamers, but is not used for cargo vessels, as it lacks in profitable carrying capacity. The midship section of the cargo ship is on the lines shown in Fig. 1.

Construction.—In designing a ship the midship area is computed and a midship section made from which the proportions of the other parts of the ship are calculated. The whole plan of the ship is then drawn in three related sectional plans, called the sheer-plan, the body-plan and the half-breadth plan. The sheer-plan is a projection on a vertical longitudinal plane dividing the ship on its centre line into two parts and gives a complete view of the side, representing the length, depth, rake of the stem and stern, with the wales, water-lines, decks, ports, masts and channels. The body-plan is a projection of the largest vertical and athwartship section, showing the breadth and having described upon it every timber composing the

frame of the ship, those running forward from the place of greatest breadth being described on the right hand, those running aft on the left of the centre line. The half-breadth plan shows the half-ship lengthwise as seen from above. The water-lines are drawn on the sheer-plan as parallel straight lines; they are dotted in or drawn in blue ink on the half-breadth plan, and show the width and horizontal curves of the hull at different levels corresponding with the water-lines in the sheer-plan. Half-models of the vessel are also made. These are constructed of thin strips of wood laid horizontally on each other, which represent the parallel water-lines, and can be taken apart to serve as models for the full-sized drawing. When the plans are complete full-sized drawings are traced in chalk on the floor of a room called the mold-loft, which is usually of a length equal to half that of the largest ship, in addition to the whole height of her hull. This operation is called laying off the ship. It supplies the workmen with the exact shape and position of that which constitutes what is called the frame of the ship. Pine models are then made of the different parts. The material formerly used in ship construction was timber, but this is now superseded by iron, and iron again is being in most cases replaced by steel. Wood is rarely used except for the smaller sea-going

FIG. 6.

Midship section of wooden vessel: A, keel; B, keelson; C, false keel; D, floor; EE, futtocks; F, top-timber; G, lengthening piece; HH, wales; I, diminishing planks; K, bottom planks; L, garboard strakes; M, beam; N, deck; O, shelf; P, waterway; Q, spirketting; R, clamps; S, knees; T, side keelsons; V, limber strakes; W, rough-tree rail; X, mast.

vessels, coasting craft and small yachts and boats. In the haste to replace the shipping lost by the German submarine warfare the building of wooden ships was extensively revived. The materials commonly used for wooden vessels are oak, teak, cedar, pine, beech, elm and many others, some being more suitable for one purpose, and some for another. In forming the separate pieces of the frame, which is technically called the conversion of the timber, the principal points to be studied are the use of the proper wood to give the requisite strength, rigidity, elasticity or toughness to each part;

the selection of pieces from which the most important parts can be cut in the most perfect manner, and all the frame made as strong and free from faults as possible; and lastly, the economical use of timber. The last object is often found to be practically antagonistic to the others, for though a small gain which sacrifices the efficiency of a costly machine can never be dreamed of as economy, it is not always easy to hit the exact mean between waste of material and sacrifice of efficiency; and when a low prime cost is an object, false economy is often practised deliberately. It is one of the advantages of the use of iron that the cost of material can be more exactly proportioned to the degree of efficiency it is designed to secure.

Keel and Frame.—The keel is usually made of elm, which is tough and not easily injured by water and is very suitable for receiving the numerous fastenings necessary to fit the other parts into it. In large vessels the keel is usually made of several pieces of timber scarfed together. The keel is not perfectly horizontal, but deeper at the stern than the bow, which gives the ship greater steadiness and freedom of motion. Below the keel is placed the false keel, of elm four to five inches thick, which protects the true keel from abrasion and gives greater steadiness to the ship. At both ends of the keel is placed the deadwood, which, cut into a curvilinear form at its upper surface, forms the line of the bottom of the ship's body. The stem and stern posts are set up at each extremity. The stem post is curved at its lower extremity. In a large ship it is divided into three pieces, called upper, lower and middle. The scarf which unites the stem post with the keel is called the boxing. The stern post is, if possible, made of one piece of oak, so as to have greater strength to support the rudder. It is inserted into the keel by tenons and mortices. The frame of the ship consists of floors, cross-pieces, futtocks and top timbers. The floor timbers are placed across the keel perpendicularly to its length, the upper surface of the keel and deadwood being cut to receive them. They are fastened in various manners. The timbers which join the floor are called the first futtocks. Other floors and futtocks are placed upon the first to complete the frame. The timbers of the frame below the surface of the water are curvilinear, above it nearly rectilinear. The distance between the frames is called room and space. Upon this the relative weight and strength of the ship greatly depend. The stemson is worked in as a support to the stem; the keelson, placed above the keels, serves to secure the floor timber and is scarfed to the stemson and sternson, which latter is bolted to the stern post. The beams which support the decks are received on longitudinal ribs called shelves, which form part of the frame, and above which are the waterways. The frame being completed, the skin or planking is applied, the vessel being first set upright and plumbed to ascertain that her frame is duly proportioned. The outer planking of a large vessel of oak is three to six inches thick. It is fastened to the ribs by bolts and trenails or by plugs of oak tightened by wedges. The decks of a ship are not completely flat, but are set to the segment of a large circle, which enables them to throw off the water. The holes

for carrying away the water are called scuppers. The seams of the outer planking of a wooden vessel are made watertight by caulking. This is forcing oakum (see OAKUM), by means of sharp iron wedges called caulking irons, into the seams of the planking, which are forced

FIG. 7.

open by reaming irons. The seams are then payed with melted pitch. The decks are also caulked with oakum.

Iron and Steel.—For shipbuilding purposes iron and steel have been found by experience to be greatly superior to wood. An iron vessel is lighter than a wooden one of the same size, and with iron an equal strength may be obtained with less weight. Iron is also far more manageable than wood, as it can be bent with ease into any required shape. Steel is a still lighter material than iron. The same names for the different parts are generally retained in building with iron or steel, though they have little correspondence with the parts of a wooden vessel except in position. A diagram of half the mid-ship section of a modern steel vessel is shown in Fig. 7. The keel is of far less importance than in wooden ships, and does not as in them hold the position of foundation or "back-bone" to the whole structure, since an iron vessel is designed to be mutually supporting throughout. An iron ship, in fact, resembles a tubular iron bridge, closed at both ends, and the deck is of as much importance as the bottom to the strength of the whole. The keel is constructed of plates riveted together, and sometimes is made hollow. From it, and riveted to it on either side, rise the ribs, which are girders built up of plates, and to the ribs on the outside is fastened the plating. The plating consists of sheets of metal one inch or more in thickness, overlapping each other at the edges, where they

are riveted together at intervals of three and one-fourth to four inches. The plates vary in thickness according to position and strength required. Figure 8 shows the lines of plating as laid out on a body plan. There may be an inner skin of plating as well as an outer, and this of course adds to the strength and safety of the vessel. The ribs are tied together and at the same time held rigidly in place by means of iron, which support the deck or decks. The decks consist of wooden planking with thin metal plates below. In the finer class of ships there are water-tight partitions or bulk-heads of iron stretching across the vessel from side to side and from keel to deck, with water-tight doors in them, so that if in case of an accident the water gets into one of them the rest may keep the ship afloat.

Fabricated Ships.—The term "fabricated ship" signifies a type of steel vessel on which the punching and shaping of plates and "shapes" and a part of the assembling and rivetting is done in a shop ordinarily employed in structural iron work; as, for instance, bridge building, or steel frames for skyscrapers. This plan, a strictly American idea put into operation during the Great War, and adopted at once by most of the shipbuilding nations, has the great advantage of utilizing the expert knowledge of steels and the superior special equipment of the steel worker's shop for the manufacture of parts amounting to about 80 per cent of the weight of steel in a vessel. It has been found practicable to make the entire centre body of the ship in this way, leaving only the bow and stern to be fabricated in the shipyards. The result has been that about 40 per cent of the time of the expert shipwright has been saved for work that only he could do, and the yearly output of the shipyards of the country has been increased proportionately.

Launching.—The launching of a vessel is a delicate operation, and, as marking the completion of the most important labors of the

FIG. 8.

shipbuilder, is usually made the occasion of a public exhibition and celebration. Two parallel inclined platforms of solid timber are laid one on each side of the keel, at the distance of a few feet from it and extending from the stem

as far below the stern as can be reached at low water. In this position they are carefully and firmly blocked and supported throughout their length. This double platform is called the ways. Upon it a second system of timber is loosely laid, and well greased between. The space from these last to the ship's bottom is everywhere filled with wedges of soft wood fashioned to its curves. The whole is called the cradle. The extremities of the cradle at the bow and stern are bound tightly across the keel with chains or ropes, and it is further kept from spreading by stout moldings, which overlap the outer edges of the ways. When the rising tide has reached well up the ways the wedges are simultaneously driven on every side, and the ship is raised from the blocks on which she has hitherto rested, and made to repose entirely on the cradle. The shores are all removed except the two spurs or dog-shores near the stem and when the proper moment has arrived these are also knocked away by falling weights, the rope holding up which is cut when all is ready. The vessel, now abandoned to her weight and encouraged by the yielding of the grease, begins slowly sliding along the inclined plane; her motion becomes at each moment more and more rapid until finally the noble fabric has abandoned its union with the land and entered upon its destined element.

Masts and Spars.—There are various rules for sparring sailing ships, all founded upon their length and breadth, which are the main elements of stability. It may be sufficient to name one simple rule for the length of the main mast, this being the prime mover; deduct one-twelfth from the vessel's extreme breadth, multiply the result by two; this will give height of mast from deck. The topmast may be three-fifths of the lower mast, the main yard seven-eighths of the same, and so on upward. The foremast may equal seven-eighths of the main, with upper masts and yards in proportion. The mizzen mast, if stepped on the keelson, is five-sixths of the main mast. The best rules on this subject are perhaps found in tables accurately prepared, in which the lengths of the masts are given in fractions of the ship's breadth and those of the yards in fractions of the length. For the rest, it will be in most cases necessary to modify any given rule, in all instances, with immediate reference to the particular model of the ship and to the uses for which she is destined. It would be an advantageous improvement in merchant ships, not sparred to the extent of their capacity, to make the fore and main masts in all cases of equal dimensions. With improved appearance they would have all the respective spars and sails, except the courses, answering equally for both masts. This would enable them to go to sea with fewer spare ones, or to derive more advantage from the usual number. In small ships all the spars are of single sticks of pine timber, which, for equal contents, are always stronger; but for ships above 600 or 700 tons it is impossible to procure single trees sufficiently large and then it becomes necessary to resort to made masts (so-called), which are of oak and pine, very artificially put together and bound with stout hoops of iron. Hollow-iron masts are also frequently used.

Rigging.—Many large vessels are fitted with

four masts, some with five. The standing and part of the running rigging are formed of wire rope. The masts and bowsprit of a ship are not abandoned to their own unsupported strength, but require to be sustained by the standing rigging. This consists, for the bowsprit, of gammoning and bob-stays, confining it down to the stem; and shrouds, which sustain the immense lateral pressure which it endures when on a wind. The jib-boom and flying jib-boom are in like manner supported by means of martingales and guys. The foremast is supported by three or four pairs of shrouds on either side and by two stays led forward to the bowsprit. The foretop mast is supported by shrouds setting up in the top, back-stays descending to the channels (broad pieces of planks fixed edge-wise to the outside of the vessel for spreading the lower rigging), and stays leading to the bowsprit end. The top-gallant and royal masts have also their shrouds setting up through the cross-trees, their backstays descending to the channels and their stays leading to the jib and flying jib-booms. In like manner are the main and mizzen masts supported, except that the main-stays set up on deck beside the heel of the bowsprit, the main-top-mast-stays at the head of the foremast, the main-top-gallant-stay to the fore-top-mast-head and main-royal-stay to the fore-top-gallant-mast-head. The mizzen-stay also sets up beside the mainmast and the same in ascending. The running rigging consists of the tacks and sheets that serve to spread the sails, the halyards, traces, lifts, clewlines and all other ropes used in making, taking in or manœuvring the sails.

Sails.—The sails of a ship are square sails bent to the yards and fore-and-aft sails traversing on stays or bent to gaffs. Let us describe an entire suit, beginning forward. On the extremity of the bowsprit is the flying jib, a three-cornered sail, which goes from the end of its boom upward along its stay, leading to the fore-top-gallant-mast-head and confined to the stay by rings of wood or iron, called hanks. The jib, which leads from its boom to the fore-top-mast-head, is of similar form and so is the fore-top-mast-stay-sail, running from the bowsprit end toward the masthead. On the foremast we have the foresail, bent to the foreyard and spread at the foot by means of tacks and sheets; above it, the fore-top-sail, bent to the top-sail-yard, by means of which it is hoisted aloft, while its lower corners are spread to the extremities of the foreyard; next the top-gallant-sail, bent to its yard and sheeting home to the top-sail-yard, and so with the royal and sky sail. Double top-sails and top-gallant-sails are now much in use, that is to say, these sails are practically made each into two sails, which gives greater ease in handling. All these sails are turned at pleasure, to be presented to the wind, by means of braces attached to their yard-arm, and leading to the mainmast. The mainmast is furnished with a similar suit of sails, somewhat larger; the mizzen, also, though smaller than either, instead of a square sail on the lower mast, it has a gaff sail, hoisting up and down abaft the mast. Some ships have similar gaff sails on the fore and main masts, which are found of great use in gales of wind as a substitute for storm staysails. Most carry also light staysails between the masts; but they are

very troublesome and worse than useless. Studying sails extended on special spars outside the square sails when going large are very useful. The perfection of equipping a ship with spars, rigging and sails, consists in so disposing them, that, in a whole-sail breeze, the centre of effort of all the sails will be in the same line with the ship's centre of rotation; or that the efforts of the forward and after sails to turn the ship will be so exactly balanced as not to require any continued assistance from the rudder in either direction; for this, while it impedes her progress, does not leave the entire force of the rudder disposable when necessary to turn. Of the two evils, however, seamen have more patience with a ship disposed to approach the wind than with one needing the continued action of the helm to keep her from falling off.

Cargo and Ballast.—When the articles in a ship's cargo are heavy and light, the heavier are placed nearest the bottom, to increase the ship's stability. When, however, all are heavy, there may be danger of making a ship too stiff; so that, not being balanced, she will roll violently, and, perchance, risk the fracture of a mast, or even spring a leak. To obviate this danger the cargo should be raised; if iron, some should be stowed between decks; if coal or salt, it may be heaped up in the centre, taking care to secure it against shifting, should the ship be knocked down by a sea or squall. Heavy articles should never be placed toward the extremities, lest they promote pitching. The cargo and the ship should be considered as one integral whole, every precaution being taken in loading to preserve the proper relations between the centre of gravity and the centre of buoyancy. In all cases care must be taken to preserve the trim of the ship—that just proportion between her draft forward and aft which the estimate of the builder, or, when a voyage has been made, experience itself, has determined to be most favorable to rapid sailing. See also NAVIGATION; SHIPBUILDING.

SHIP IN ART AND SYMBOLISM. As symbol of the State a ship has been used from very distant times; as such it is depicted as steered by its statesmen through the shoals, rocks and storms of internal troubles, false policies and the machinations of enemy countries. In Christian symbolism also the ship takes the same significance. It was depicted riding in safety amidst storms as emblematic of the Church in the early days surviving the direst persecutions. Frequently the mast and yard-arm are used to signify the Cross and the peak of the mast is surmounted

by a dove or the sacred monogram. The symbol of the ship is dilated on by early Christian writers, as Saint Clement of Alexandria. In the Catacombs hanging lamps have been discovered in the form of masted ships, and the design appears frequently on the Catacomb walls. Sometimes the ark of Noah takes the place of the masted ship. Often, however, in ancient times, as at present, the ship is introduced as an emblem of maritime power. In ecclesiastical art a ship has been pictured in the hands of Saint Jude; Saint Ursula has been depicted with a ship near her, or as landing from a ship; Saint Melanius has been portrayed as lying dead on a ship which is sailing against the stream; Saint Castor has been pictured saving a ship from sinking; Saint Werenfrid has been represented with a ship in his hand having a coffin in it; Saint Anselm has been portrayed holding the model of a ship, as has Saint Mary of Succours (Husenbeth). The term ship is used for the ecclesiastical vessel that holds the incense, but it is usually of *boat* form. The finest centrepiece for the banquet tables of the Middle Ages was a ship of gold or silver made as a masterpiece of the goldsmith and termed a *nef*.

CLEMENT W. COUMBE.

SHIP CANALS. Great ship canals across isthmuses or peninsulas, to make shorter sea routes or avoid storm passages, or surmount falls, or to make seaports of inland cities, have been the speculations of dreamers for ages; but the developed and hurried commerce of this age has made some of them imperative. The ship canals of the world are 11 in number, as follows:

1. The Suez Canal (q.v.), begun in 1859 and completed in 1869.
2. The Cronstadt and Saint Petersburg Canal, begun in 1877 and completed in 1890.
3. The Corinth Canal, begun in 1884 and completed in 1893.
4. The Manchester Ship Canal, completed in 1894.
5. The Kaiser Wilhelm Canal (q.v.), connecting the Baltic and North seas, completed in 1895.
6. The Elbe and Trave Canal, connecting the North Sea and Baltic, opened in 1900.
7. The Welland Canal, connecting Lake Erie with Lake Ontario. See CANADIAN CANALS.
- 8 and 9. The two canals, United States and Canadian, respectively, connecting Lake Superior with Lake Huron.
10. The Panama Canal.
11. The Cape Cod Canal.

The canal connecting the Bay of Cronstadt with Saint Petersburg is described as a work of great strategic and commercial importance to Russia. The canal and sailing course in the Bay of Cronstadt are about 16 miles long, the canal proper being about 6 miles and the bay channel about 10 miles, and they together extend from Cronstadt, on the Gulf of Finland, to Saint Petersburg. The canal was opened in 1890 with a navigable depth of 20½ feet, the original depth having been about 9 feet; the width ranges from 220 to 350 feet. The total cost is estimated at about \$10,000,000.

The next of the great ship canals connecting bodies of salt water in the order of date of construction is the Corinth Canal, which connects

the Gulf of Corinth with the Gulf of Ægina. The canal reduces the distance from Adriatic ports about 175 miles and from Mediterranean ports about 100 miles. Its length is about four miles, a part of which was cut through granite soft rock and the remainder through soil. There are no locks, as is also the case in both the Suez and Cronstadt canals, already described. The width of the canal is 72 feet at bottom and the depth $26\frac{1}{4}$ feet. The work was begun in 1884 and completed in 1893 at a cost of about \$5,000,000. The average tolls are 18 cents per ton and 20 cents per passenger.

The Manchester Ship Canal, which connects Manchester, England, with the Mersey River, Liverpool, and the Atlantic Ocean, was begun 11 Nov. 1887 and opened for traffic 1 Jan. 1894. The length of the canal is $35\frac{1}{2}$ miles, the total rise from the water level to Manchester being 60 feet, which is divided between four sets of locks, giving an average to each of 15 feet. The minimum width is 120 feet at the bottom and averages 175 feet at the water level, though in places the width is extended to 230 feet. The minimum depth is 26 feet, and the time required for navigating the canal from five to eight hours. The total amount of excavation in the canal and docks was about 45,000,000 cubic yards, of which about one-fourth was sandstone rock. The lock gates are operated by hydraulic power; railways and bridges crossing the route of the canal have been raised to give a height of 75 feet to vessels traversing the canal, and an ordinary canal whose route it crosses is carried across by a springing aqueduct composed of an iron caisson resting upon a pivot pier. Cost, \$75,000,000.

Two canals connect the Baltic and North seas through Germany, the first, known as the Kaiser Wilhelm Canal, having been completed in 1895 and constructed largely for military and naval purposes, but proving also of great value to general mercantile traffic. Work upon the Kaiser Wilhelm Canal was begun in 1887, and completed in 1895. The total excavation amounted to about 100,000,000 cubic yards, and the cost about \$40,000,000. See KAISER WILHELM CANAL.

The Marseilles-Rhone Canal was begun in April 1911. It is about 50 miles long. For the first three miles out of Marseilles it is hardly a canal, properly speaking, being located off shore. It then turns sharply, and a tunnel of four and one-half miles passes under the mountain ridge near the shore; it next proceeds by the easiest overland route to the Rhone at Arles.

Three ship canals intended to give continuous passage to vessels from the head of Lake Superior to Lake Ontario and the Saint Lawrence River are the Welland Canal, originally constructed in 1833 and enlarged in 1871 and 1900 (see CANADIAN CANALS); the Saint Mary's Falls Canal at Sault Sainte Marie, Mich., opened in 1855 and enlarged in 1881 and 1896; and the Canadian canal at Saint Mary's River, opened in 1895. In point of importance, measured at least by the present use, the canals at the Saint Mary's River by far surpass that of the Welland Canal, the number of vessels passing through the canals at the Saint Mary's River being eight times as great as the number passing through the Welland, and the tonnage of the former being nearly 40 times as great as that of the latter. The traffic is, in fact, heavier

than that through the Suez Canal, being about two and a half times as much. One of the important products of the Lake Superior region, iron ore, is chiefly used in the section contiguous to Lake Erie, and a large proportion of the grain coming from Lake Superior passes from Buffalo to the Atlantic Coast by way of the Erie Canal and railroads centring at Buffalo. The most important article in the westward shipments through the Sault Sainte Marie canals — coal — originates in the territory contiguous to Lake Erie. These conditions largely account for the fact that the number and tonnage of vessels passing the Saint Mary's River canal so greatly exceed those of the Welland Canal. During the season of 1915, from April to December, 21,233 vessels, with a total tonnage of nearly 50,000,000, passed through both these canals, 16,910 using the American and 4,323 vessels using the Canadian. In 1907 work was begun on enlarging the lock of the American canal, which is now almost completed, being opened for traffic in 1914. It is 80 feet wide and 1,350 feet between gates, the masonry being 1,750 feet in length. It can accommodate two of the biggest lake steamers at once and be filled or emptied within six minutes.

The Cape Cod Canal is of recent construction; it was begun in 1909 and opened to traffic 1 Aug. 1914, to vessels drawing only 18 feet of water, but since 1 Oct. 1915 vessels of 20 feet draught have been able to pass through. It connects Barnstable Bay with Buzzard's Bay, Mass., thus saving the coastwise shipping the dangerous navigation around Cape Cod. The canal is 12 miles long, sea-level in construction and has a minimum depth of 30 feet. Up to the end of 1915 over 9,000 vessels had passed through, including a number of gunboats and submarines of the United States navy. Electric illumination from one end of the canal to the other makes night navigation possible. The tolls range from \$3 for motor boats to \$70 for larger freight steamers.

In 1915 the State legislature of New Jersey authorized the State Board of Commerce and Navigation to continue a survey for a canal from Bordentown, on the Delaware River, to Morgan on Raritan Bay, to be 33 miles in length and to cost \$45,000,000, as estimated in 1911. This project is in connection with the Federal plan involving a series of inland waterways running down the coast out of range of the guns of warships that might attempt to blockade the coast. On 3 March 1905 Congress passed a River and Harbors Act, which authorized a survey "for the construction of a continuous waterway, inland where practicable, from Boston to Beaufort, N. C.," the minimum depth of which was to be 25 feet, suitable for army, navy and commercial purposes. In 1912 Congress made an appropriation, in continuance of this project, for the purchase of the old Albemarle and Chesapeake Canal and its improvements. In 1913 General Bixby, chief of engineers, had prepared a detailed plan with estimates for the contemplated waterway, involving a total cost of \$30,000,000.

SHIP-FEVER. See TYPHUS FEVER.

SHIP-MONEY, a tax which had much to do with provoking the rebellion which cost Charles I his head. It was customary in England in times of extraordinary peril for the

sovereign to call upon the seaports and maritime counties to supply ships-of-war for the national defense. The ships which took part in the defeat of the Spanish Armada were obtained in this way. No such peril existed when Charles I, in October 1634, ordered the magistrates of London and other seaport towns to provide ships-of-war, and also empowered the magistrates to levy a tax for that purpose. Resistance to the levy was met by further decrees, extending the tax to the whole kingdom, and directing that every landholder and other inhabitant be assessed according to his means, and the tax collected by distress if necessary. When John Hampden refused to pay the tax, and was brought to trial, the judges decided, eight to four, in favor of the Crown. One of the early acts of the Long Parliament in 1640 was to declare the ship-money tax illegal and no attempt has since been made to collect ship-money in England.

SHIP RAILWAY, a railroad for transporting vessels from one body of water to another. Capt. J. B. Eads' plan for the Tehuantepec Ship Railway across the isthmus between North and South America, in Mexican territory, attracted great attention, though it was never constructed. It consisted essentially of a series of some 8 or 10 tracks, having a carrying car or cradle of some five sections, with altogether 1,000 wheels. Calculated for a vessel of 10,000 tons, this would not give a pressure so great as that of an ordinary locomotive. A ship-railway is in operation by the Canadian government between Chignecto Bay, in the Bay of Fundy, across the isthmus to Northumberland Straits, a distance of 17 miles. This enables vessels to go from Prince Edward Island to Saint John, New Brunswick, in 12 hours, and greatly facilitates the transport of grain in bulk from the lake ports to New Brunswick. The vessels are raised by hydraulic pressure a height of 40 feet to the level of the railway, and placed on a double track 18 feet from centre to centre. The flexible car system of ship-railway invented by William Smith, harbor engineer of Aberdeen, Scotland, is designed to allow the use of ordinary railway gradients. The car is in sections, each carried on a compound bogie running on parallel lines. Vertical and lateral flexibility are secured, and the ship is sustained on the car by water cushions, so that it is virtually kept floating. The ship is raised onto the cars by means of a submerged shipway enclosed within a wet dock.

SHIP REGISTRY ACT approved 18 Aug. 1914, provided for the admission of foreign-built ships to American registry for foreign trade, and for other purposes. In section 5 of the act entitled 'An act to provide for the opening, maintenance, protection and operation of the Panama Canal and the sanitation and government of the Canal Zone,' the words "not more than five years old at the time they apply for registry," were repealed. The President of the United States was authorized, whenever in his discretion the needs of foreign commerce may require, to suspend by order, so far and for such length of time as might be desirable, the provisions of law prescribing that all the watch officers of vessels of the United

States registered for foreign trade should be citizens of the United States. Under similar conditions the President was also authorized to suspend the provisions of the law requiring survey, inspection and measurement by officers of the United States of foreign-built vessels admitted to American registry under this act.

SHIP RIGGING. The many special terms used to designate the various parts of the standing and running rigging in the days of the sailing vessel are given below:

THE STANDING RIGGING.

Bobstay.	Main-topgallant back-stays.
Bowsprit-ahroud.	Main-royal back-stays.
Martingale-stay.	Main-lift.
Jib-boom guys.	Main-topsail lift.
Fore-stays.	Main-topgallant lift.
Fore-topmast stays.	Main-royal lift.
Inner-jib stay.	Mizzen-stays.
Outer-jib stay.	Mizzen-topmast stays.
Flying-jib stay.	Mizzen-topgallant stay.
Fore-royal stay.	Mizzen-royal stay.
Fore-rigging.	Mizzen-rigging.
Fore-topmast rigging.	Mizzen-topmast rigging.
Fore-topgallant rigging.	Mizzen-topgallant rigging.
Fore-cap back-stay.	Mizzen-cap back-stay.
Fore-topmast back-stays.	Mizzen-topmast back-stays.
Fore-topgallant back-stays.	Mizzen-topgallant back-stays.
Fore-royal back-stay.	Mizzen-royal back-stays.
Fore-lift.	Crossjack lift.
Fore-topsail lift.	Mizzen-topsail lift.
Fore-topgallant lift.	Mizzen-topgallant lift.
Fore-royal lift.	Mizzen-royal lift.
Main-stays.	Jigger-stays.
Main-topmast stays.	Jigger-middle stay.
Main-topgallant stays.	Jigger-topmast stay.
Main-royal stays.	Jigger-topgallant stay.
Main-rigging.	Jigger-rigging.
Main-topmast rigging.	Jigger-topmast rigging.
Main-topgallant rigging.	Jigger-topmast back-stays.
Main-cap back-stay.	Jigger-topgallant back-stays.
Main-topmast back-stays.	

THE RUNNING RIGGING.

Fore-tack.	Main-royal braces.
Fore-sheet.	Main-topsail halyards.
Fore clew-garnet.	Main-topgallant halyards.
Fore-braces.	Main-royal halyards.
Fore lower topsail sheet.	Main signal-halyards.
Fore lower topsail clew-lines.	Main reef-tackles.
Fore lower topsail braces.	Main-topsail reef-tackles.
Fore upper topsail sheets.	Crossjack tack.
Fore upper topsail clew-lines.	Crossjack sheet.
Fore upper topsail braces.	Crossjack clew-garnet.
Fore lower topgallant sheet.	Crossjack braces.
Fore lower topgallant clew-lines.	Mizzen lower topsail clew-lines.
Fore lower topgallant braces.	Mizzen lower topsail braces.
Fore upper topgallant sheet.	Mizzen upper topsail sheet.
Fore upper topgallant clew-lines.	Mizzen upper topsail clew-lines.
Fore upper topgallant braces.	Mizzen upper topsail braces.
Fore-royal sheet.	Mizzen lower topgallant sheet.
Fore-royal clew-lines.	Mizzen lower topgallant clew-lines.
Fore-royal braces.	Mizzen lower topgallant braces.
Fore-topsail halyards.	Mizzen upper topgallant sheet.
Fore-topgallant halyards.	Mizzen upper topgallant clew-lines.
Fore-royal halyards.	Mizzen upper topgallant braces.
Fore-signal halyards.	Mizzen-royal sheet.
Fore reef-tackles.	Mizzen-royal clew-lines.
Fore topsail reef-tackles.	Mizzen-royal braces.
Main-tack.	Mizzen-topsail halyards.
Main-sheet.	Mizzen-topgallant halyards.
Main clew-garnet.	Mizzen-royal halyards.
Main-brace.	Mizzen-signal halyards.
Main lower topsail sheet.	Crossjack reef-tackles.
Main lower topsail clew-lines.	Mizzen-topsail reef-tackles.
Main lower topsail brace.	Jigger peak-halyards.
Main upper topsail sheet.	Jigger brails.
Main upper topsail clew-lines.	Jigger gaff-topsail sheet.
Main upper topsail braces.	Ensign halyards.
Main lower topgallant sheet.	British ensign.
Main lower topgallant clew-lines.	Gaff-topsail halyards.
Main lower topgallant braces.	Vangs or Vanes.
Main upper topgallant sheet.	Jigger outhaul.
Main upper topgallant clew-lines.	Boom topping lift.
Main upper topgallant brace.	
Main-royal sheet.	
Main-royal clew-lines.	

THE RUNNING RIGGING—continued.

Boom guys.	Mizzen-topgallant stay-sail sheet.
Boom sheet.	Mizzen-royal stay-sail sheet.
Flying-jib sheet.	Jigger stay-sail sheet.
Outer-jib sheet.	Jigger-topmast stay-sail sheet.
Inner-jib sheet.	Jigger-topgallant stay-sail sheet.
Fore-topmast stay-sail sheet.	Reef points.
Fore-bowline.	Fore-buntlines.
Main-topmast stay-sail sheet.	Main-buntlines.
Main topgallant stay-sail sheet.	Crossjack buntlines.
Main-royal stay-sail sheet.	
Mizzen-topmast stay-sail sheet.	

SHIPBUILDING INDUSTRY AND CONSTRUCTION. The earliest history of shipbuilding and the development of the sailing ship and the steam ship will be found under the titles **SAILING VESSELS; STEAM VESSELS.**

United States.—In the United States shipbuilding began with the *Virginia*, launched in 1607 at the mouth of the Kennebeck River, by the Popham colony. This little vessel was of the type of the English pinnace, and though of but 30 tons, it several times made the crossing of the Atlantic in safety. The first decked-over vessel built in America was the *Onrust*, launched in 1614 at New Amsterdam. In 1621 the *Blessing of the Bay*, launched at Medford, Massachusetts, was the first of the unnumbered fleet which from that time forward slipped one by one down the ways of the colony's many shipyards into the waters of Massachusetts.

The most conspicuous advance in that period was Dominie Peters's "great ship" of 300 tons, launched at Salem in 1641. This notable vessel exceeded the famous *Mayflower* by 120 tons, and set the pace not only for the shipbuilders of the New World, but for the Old World as well, where few vessels so large had been equal to this product of a mere colony scarce 20 years old.

By 1676 the ports of Massachusetts had 30 ocean-going vessels of between 100 and 250 tons, besides some 700 smaller vessels engaged in the coasting trade. In 1700 Boston was the home port of 194 ocean ships, while New York boasted but 124. In the 40-year period from 1674 to 1714 the Massachusetts records show the launching of more than 1,000 ships for the American merchant fleet, and 240 others which were sold abroad to foreign owners. The great abundance of the finest ship timber in the American forests—oak, white pine, and pitch pine—gave particular impetus to American shipyards, for English forests had begun to show serious depletion; and many shiploads of American shipbuilding timber were sent annually to British shipyards from the ports of Maine and New Hampshire.

While Massachusetts and New York had been the pioneers in American shipbuilding, the other colonies had speedily followed the example; in the Earl of Sheffield's 'Obser-

vations on the Commerce of the American States' (London 1783), a record of American shipbuilding for the year 1769 shows the number of ships built in that year by each Colony, and their aggregate tonnage in preceding table.

By 1770 Massachusetts was building half the total number of ships constructed in America.

In 1791 Alexander Hamilton, as Secretary of the Treasury, reported that the American merchant marine aggregated 476,274 tons. In 1800 the record for the year was 995 ships, with a combined tonnage of 106,000 tons. Shipbuilding industry in the United States reached its apex in 1855, the launching in that year numbering 2,027 vessels, and the sales abroad amounted to 65,887 tons, chiefly added to the British marine. The threat of withdrawal of mail subsidies by Congress had its effect in diminishing shipbuilding, as the best class of American vessels could not be run without them. When the threat became a fact in 1858 the doom of the American lines was sealed and the carriage of the American mails was transferred to the heavily subsidized ships of Great Britain. See **MERCHANT MARINE OF THE UNITED STATES.**

Shipbuilding on the inland waters of the country began in 1800 when the *Saint Clair*, of 110 tons, was launched at Marietta, Ohio, and the *Monongahela Farmer*, of 250 tons, was launched at Elizabeth, Pa. These were both full-rigged ships and set sail on the Ohio for the Gulf and thenceforward belonged to the ocean fleet. The *Louisiana*, of 300 tons, launched in 1804 at Pittsburgh, was the most notable of the ships built in those days in the interior.

The change from wood to iron in ship construction about the middle of the 19th century, was followed by the revolutionary methods of steel shipbuilding, and by 1890 steel had displaced iron in the shipyards of Great Britain and the United States. American shipbuilding under the era of steel reached its perfection in 1892 and 1896, when the *Saint Louis* and the *Saint Paul*, two ocean liners, were built by the Cramp Company. These vessels were constructed entirely of domestic material, thus marking a new era in American shipbuilding.

Steel-Schooners.—The use of steel in the construction of the modern passenger steamships (see **STEAM VESSELS**) and of the modern naval vessel (see **WARSHIPS**) developed the steel freighter, the merchant schooner with four, five, six or seven masts. Indeed the development of the multi-masted merchant schooner, which has advanced with such rapid strides during the past few years, is one of the most remarkable features in the shipbuilding industry of the Atlantic coast. The fore-and-aft schooner has always been a favorite type of ship in the American merchant trade, whether coasting or deep-sea, and the great breadth of hull and length of spars of such craft have rendered them an easily recognized type the world over. As compared with the square-rigged vessels of the schooner, brig, brigantine, or bark type, the American fore-and-aft has the advantage of being a better craft when sailing close-hauled and of requiring fewer men to man it. In an earlier day of the development of our merchant marine in the coasting trade, the two-masted schooner was the common type; then came the three-masted schooner, and this was followed by vessels of four, five, six and now seven masts. The

COLONY	Number built	Aggregate tonnage	Average tonnage
Massachusetts.....	137	8,013	60
New Hampshire.....	45	2,452	55
Connecticut.....	50	1,542	31
Pennsylvania.....	22	1,469	67
Rhode Island.....	39	1,428	37
Maryland.....	20	1,344	65
Virginia.....	27	1,269	47
New York.....	19	955	50
South Carolina.....	12	789	65
North Carolina.....	12	607	50
New Jersey.....	4	83	20
Georgia.....	2	50	25

carrying capacity of these schooners, the largest of which are engaged almost entirely in the coal-carrying trade, is exceedingly large. Thus, the five-masted schooner is 318 feet in length, 44 feet beam, and 21½ feet in depth. The vessel will carry 4,000 tons of coal on her maximum draft. A six-masted schooner is 330 feet in length, 48 feet in beam, and has 22 feet depth of hold. On her maximum draft of 24 feet she will carry 5,500 tons of cargo. Her lower masts are each 116 feet in length, and her topmasts 58 feet.

The seven-masted steel schooner of modern build has a bar keel of forged steel three and one-half inches in width by 12 inches in depth, which extends from stem to sternpost. There is a cellular double bottom with a continuous, single, vertical, keel plate weighing 22.5 pounds to the square foot. The upper bilge-strake is of 28¾-pound plate for two-thirds of the length. The middle bilge-strake is of 30 pounds weight for the same distance and the lower bilge-strake 25 pounds. The bottom strake is of 20-pound plate, while the garboard strake is of 29-pound plate for two-thirds of the length. All of the plating reduces to 18¾ pounds at the ends of the vessel, except in the case of the garboard strake, which will reduce to 25 pounds at the ends. There are three complete decks, which are of steel plating, the upper deck, forecastle and poop-deck being wood-covered. A collision bulkhead is worked in at a suitable distance from the stem. The lower masts throughout the vessel are built of steel, with lapped edges, flush butts, and stiffening angles extending inside for the full length. The plates are single-riveted at the edges and double-riveted at the butts. The plating is double and stiffening double at the mast-partners and at the hounds. The masts are all 135 feet in length from the mast step to the top of the upper band, and they have a uniform diameter throughout of 32 inches. The topmasts are of Oregon pine. They are 58 feet in length over all, tapering from 18 inches in diameter to 10 inches, except the foremast, which is 64 feet in length and 20 inches at its point of greatest diameter. The booms of the first five masts are 45 feet in length by 14 inches in diameter, the spanker boom being 75 feet in length by 18 inches in diameter. The total sail area of the lower sails and topsails is 40,617 square feet. All of the standing rigging, and in special cases the running rigging for the lower sails, are of a high quality of wire rope. Although this vessel is propelled entirely by sails, she carries quite a considerable instalment of machinery, including one 9-inch by 10-inch Hyde double-cylinder ship engine, and five 6-inch by 8-inch Hyde hoisting engines. There are two vertical boilers 56 inches in diameter by 90 inches high, one in the forward house and one in the after house. The boilers were built for a working pressure of 100 pounds to the square inch. There are two 8-inch by 4-inch by 6-inch duplex pumps and two direct-acting steam pumps, with steam and water cylinder, each 12 inches in diameter by 12 inches stroke. As the result of the installation of steam power on board for the purpose of hoisting anchors and sails the number of hands necessary to work this large vessel is considerably reduced, the total number required being only 19 men. The total cost of the vessel delivered was about \$250,000.

Steel Steamships.—The modern ocean liner for freight and passengers, as built of steel, has a length over all of 630 feet; breadth, 73 feet 6 inches; molded depth from keel to upper deck, 56 feet. On a draft of 33 feet the displacement is 33,000 tons, and on a maximum draft of 36½ feet, to which the vessel can be loaded whenever the depth of the harbors will admit of it, the displacement will be 37,000 tons. The space occupied by machinery is the smallest practicable, so that space for cargo may be as large as possible. In order that cargo may be readily stowed, the ordinary type of hold pillar has been dispensed with, and large box-shaped columns are fitted, supporting heavy girders which run longitudinally under the transverse beams which carry the decks. These columns are widely spaced, and in some cases only one is fitted in a hold, whereas by the older method 10 pillars would be required. A longitudinal bulkhead is fitted the whole length of the ship; this divides each hold into two separate compartments, and, therefore, the hatches are fitted in pairs, one to each hold. Some of the hatches are so large that bulky freight, such as a locomotive or freight car, or large marine or land boilers, can be lowered directly into the hold. Every hatch can be loaded or discharged simultaneously if desired. The cargo-handling plant on such a vessel is very complete, and designed so as to cut down the number of men to a minimum. Two winches and two booms are fitted to handle cargo at each hatch. The booms, 34 in number, are built of steel. Two heavy booms are fitted to lift weights of from 30 to 50 tons. The winches for cargo handling are 34 in number, all electrically operated. One hold in the ship is devoted to carrying frozen meat, and is completely insulated; its capacity being about 2,500 tons. The insulation is so arranged that ordinary cargo can be carried on return trip. The coal bunkers are located above the boilers; the ends of the bunkers being inclined in such a manner that the bulk of the coal will gravitate through chutes and be deposited on the firing platform. The capacity of the permanent bunker is over 4,000 tons, and a reserve bunker is fitted contiguous to the boiler room, having a capacity for about 2,000 tons of coal. The boilers have a working pressure of 260 pounds per square inch. They will supply steam to two main engines of the triple-expansion type, arranged side by side, working separate shafts. The propeller wheels are 20 feet in diameter, and revolve 78 times per minute. The horse power of the engines would be about 10,000, and will drive the ship at a speed of about 14 knots per hour. To realize the great size of the ship, one must but recapitulate the various decks, platforms, etc., from the keel to the top-most bridge. First there is the outer bottom of the ship; 6 feet above that is the inner bottom or floor; then within the molded or plated structure of the vessel are the orlop, lower, between, main, and upper decks. All of these decks are of steel plating, and the whole structure of the ship from the bottom to the upper deck is 56 feet in height, the upper deck running in an unbroken sweep the whole 630 feet length of the vessel. Above the upper deck are the promenade deck, the upper promenade deck, and the boat deck, this last being about 80 feet above the keel, while eight

feet above this, or 88 feet above the keel, is the captain's bridge. Now, since the vessel at her lightest draft draws 17 feet of water, the captain's bridge, when the vessel is running light, will be over 70 feet above the water, and the passengers on the topmost upper deck will be between 60 and 70 feet above the water. See SHIP.

The United States Shipping Board.—When the United States entered the World War in 1917 the preponderant demand of the army was for ships to transport men and materials to Europe. The United States Shipping Board was formed to control generally the increase and operation of the necessary ocean-going fleet, and this board established as a subsidiary the Emergency Fleet Corporation. The government advanced \$50,000,000 capital to the latter body, taking the entire issue of stock to that amount. The duty laid upon the corporation was the providing of the largest possible ship tonnage in the shortest possible time. It began its labors by taking over a large number of the existing shipyards of the country and entering upon the construction of new ones in all sections of the country whence ships could be brought to deep water. Besides these activities the structural steel works everywhere were set to work fabricating parts of ships which were later to be assembled at the shipyards. In August 1918 the corporation had under its control more than 200 shipyards, half of which it had built. These were distributed over 27 different States, and aggregated nearly 900 ways with a maximum capacity for fabricated ships of 5,400 ships per annum. The actual output was held down to about half of this figure owing to inability to get materials fast enough, and the necessity of training the large forces of unskilled labor. Advantage was taken also of yards formerly in use for the building of wooden ships, especially in the South and on the Pacific Coast, where ship timber was plentiful and within easy reach.

The largest of these new yards was that at Hog Island near Philadelphia where nearly 30,000 men were employed. Efforts were made to celebrate the Fourth of July 1918 by the launching of 100 ships throughout the country. While the goal was not quite reached, more than 90 ships were actually sent into the water on that day. As an instance of the remarkable efficiency attained in some yards the *Tuckahoe* may be cited. This vessel was a 5,500-ton steel collier of the fabricated type, and was erected in 27 days at a Camden (N.J.) shipyard. On the 40th day from the date the keel was laid this vessel put to sea with a full cargo.

At the yards on the Great Lakes the possible size to which ocean-going ships might be built was limited by the size of the locks in the Welland Canal to a length of not more than 261 feet and a beam not exceeding 42½ feet. These limitations were overcome in part by building a ship in two sections and assembling the parts when they reached tidewater in the Saint Lawrence. However, the width of the ship inexorably held them down to a limited length, not exceeding 350 feet and limited the tonnage to about 6,000 tons.

The work accomplished by the United States Shipping Board is best comprehended by comparing the present tonnage of the American

merchant marine with that existing immediately previous to the outbreak of the war. In June 1914 the total gross tonnage under the United States' flag, including the coastwise shipping and the fleet on the Great Lakes was 4,287,000 tons. In June 1919 the gross tonnage was 11,983,000 tons, an increase of 278 per cent. The larger part of this increase has been in ocean-going vessels. The steam tonnage of the United States is now 24.8 per cent of the entire tonnage of the world.

At the close of August 1919 the Shipping Board reported the delivery of 899 steel steamships, of 5,733,622 deadweight tons; 378 wooden steamships of 1,339,103 deadweight tons; and 15 composite ships of 32,500 deadweight tons—a total of 1,292 ships aggregating a deadweight tonnage of 7,125,225 tons. There were fitting out in wet basins 408 steamships aggregating 1,920,000 deadweight tons. There were on the ways in the several yards under the board's control 497 ships, aggregating 3,286,105 deadweight tons, and 227 steel steamships of a combined tonnage of 1,476,610 tons are still under contract but have not been begun.

At the close of August 1919 the Shipping Board had a total fleet of 1,280 ships under its control, with a combined tonnage of 7,706,400 deadweight tons. See, also, AMERICAN SHIPBUILDING; NAVAL ARCHITECTURE.

Ship Construction.—As the first step in the building of a ship is the designing of it, the use to which it is to be put must first be decided on. What cargo is it to carry and how much? And what speed is desired? The answer to these questions will go far to determining the ship's dimensions—length, beam and depth—and to a large extent the shape or "lines" of the under-water body and the horse power of its propelling machinery. The available depth of water in the harbors the ship is designed to visit is another controlling factor.

As the dimensions of the ship are not known, a trial design is first calculated upon the basis of the tonnage required; say, for example, 10,000 tons. The designer makes a calculation of a hull which will afford the space for 10,000 deadweight tons. The displacement of the completed ship will be the deadweight tonnage plus the weight of a hull to contain it. From experience and experiment it has been found that about 64-100ths of the whole carrying capacity (including engines, fuel, stores, etc.) must be added for the vessel itself. The ship carrying 10,000 tons will, therefore, have a displacement of about 16,400 tons. It devolves then upon the designer to determine length, beam and depth for his vessel from this total displacement. Into this problem enters first, if at all, the available depth of water in the harbors where the ship will trade. The shallower the possible draught, the greater, relatively, the beam. Aside from this the desired speed determines the proportion of length to breadth. The longer the ship—and the narrower—the speedier will she move for the same engine power. A trim underwater body with long gently flowing curves will require less horse power for a given speed than a body which is full and roomy well up to the bow and back to the stern.

For all of these calculations "constants" and "coefficients" are available to the constructor,

and his ship of 16,000 tons will, in ordinary course, figure out a length of between 450 and 470 feet and a beam of 55 to 60 feet, a draught of 25 to 28 feet, with a total depth of about 40 feet. With engines of 4,000 horse power this vessel should show a speed of about 12 knots.

In the planning of the ship the established rules of the several "Lloyds" and classification committees must be strictly adhered to in order that the vessel may be duly registered.

The chief factor in the hull of the ship is the shell plating. All other constructive parts of the ship, that is, the framing, are to be considered as practically the support and stiffening of the shell. In a large vessel the pressure of the water upon its exterior shell is enormous, the tendency being to cause a collapse. This pressure is tremendously increased by the violent blows of storm waves, and from the pitching and rolling sustained in rough water. Herein lies the demand for the knowledge of the skilled engineer, that the metal of which the ship is constructed shall be so disposed as to afford abundant strength and resistance to every possible stress and strain from without. Another series of strains arises from the load carried by the vessel, and acting from within, of great magnitude when the waves are high and the ship is subjected to a hogging strain when lying across the crest of a great wave, or to a sagging strain when lying across the trough between two waves. It is customary to regard the ship as a section of a tubular bridge, so far as the amidship's part is concerned. The ends of the vessel from their wedge-shaped construction are from that condition relatively stronger and may safely be more lightly built. The art of the shipbuilder is in the skilful adjustment of material to its purpose, so disposing it as to afford abundant strength, without interfering with generous cargo capacity.

In the more recent development of ship construction the system most approved is the longitudinal, as opposed to the transverse; the former having the advantage of stiffening the plating against transverse buckling as well as against fore-and-aft compression, a feat not attained by the transverse method of construction except by an undue and undesirable thickness of the plating and a close placing of the side frames—thus adding unprofitable weight and diminishing cargo space.

The division of the hull into watertight compartments is a feature of present shipbuilding regarded as indispensable, particularly as regards the "collision bulkhead," placed near the bow, to keep out the sea in case the bow is broken by collision. The requirements of the Lloyds associations are that the compartments shall be of such a limited size that the vessel may still float safely if two of them are breached. This provision demands at least eight transverse bulkheads in the ordinary passenger liner. The compartments are connected by water-tight sliding doors which are operated by compressed air from the bridge, in case of emergency.

Given the hull, the remaining problem is its propulsion. A certain model of hull will be found to have a definite economic speed. Above this speed the engines labor without corre-

sponding effect. This economic speed can be very closely calculated by the shipbuilder from the under-water lines of his model for the load of cargo it is to carry. He is thus able to decide upon the size of the propeller or propellers needed—their diameter and pitch, and the number of revolutions they must make per minute to drive the ship at the desired rate. Engines powerful enough to turn the propeller easily and without strain the calculated number of revolutions may then be designed. One more problem remains, that of so attaching the engines to the ship that they actually form an integral part of its construction. The whole problem of propulsion is one of delicate adjustment. The engine will run best at a certain speed, and the vessel will run best at a certain speed. The closer these two conditions can be matched, the more successful and the more durable the ship. In most vessels nothing better than a compromise is reached. The instances in which hull and engines are really mated are so rare as to excite admiration—and incidentally to mark the possibilities to be achieved.

The reciprocating engine is of satisfactory efficiency for moderate speeds, ranging up to 0.88 for triple expansion and 0.92 for quadruple expansion engines. The latter are more economical of fuel, but require so much more engine room that little if any advantage is gained on the average voyage. The steam turbine is equal in efficiency to the quadruple expansion reciprocating engine, and does equal work with considerably less fuel, but, as it cannot be run astern, a second turbine must be provided for this purpose, or a transformer employed. Furthermore the turbine is of great efficiency only at high speeds—too high to allow of its being connected directly to the propeller shaft. A combination of reciprocating engines and the turbine has worked well, where the turbine has been of the low pressure type and runs by the exhaust steam of the reciprocating cylinders. With triple screws on large vessels (20,000 tons and upward) the two wing shafts are operated by reciprocating engines and the centre shaft by the turbine. Turbines of the high speed type are successfully utilized when employed to run electric generators which, in turn, operate the shafts by electric drive.

It is quite impossible in the limits of space available in this work to even touch upon the multitudinous details of practical ship construction. For this information the student is referred to the excellent and complete treatises named below. See SHIP; SHIPBUILDING TERMS.

SHIP-SAILING. See NAVIGATION.

SHIPIBO, shē-pē'bō, South American Indian tribe of Panoan stock, living in the forested regions of the upper Ucayali River, Peru. Their existence was reported by Franciscan missionaries who visited them in 1651, but a mission established for them in 1764 was, after a brief period of success, massacred in 1767, and the Shipibos have since rarely come in contact with the whites. They are great wanderers with no fixed places of migration, and are skilled boatmen and fishermen.

SHIPKA PASS, Balkan Peninsula, extends between Bulgaria and the territory formerly known as Eastern Rumelia, since 1885 incorporated with Bulgaria, at a height of 4,600 feet above sea-level, and is 87 miles distant from Rustchuk and 50 miles northeast of Philippopolis. In the hot fight between the Russians and Turks, 1877, the Russians held the position and Suleiman Pasha lost 20,000 men in his attempt to take Fort Nicholas, on the summit of the pass, 21-26 Aug. and 9-17 Sept. 1877.

SHIPLEY, England, a town of Yorkshire (West Riding), lies three miles north-north-west of Bradford, on the river Aire. The large parish church of Saint Paul is a fine modern Gothic specimen. The principal industry is the manufacture of woollens and cloths, and the quarrying of stone. Pop. 27,700.

SHIPPEN, William, American surgeon: b. Philadelphia, Pa. 16 Oct. 1736; d. Germantown, Pa., 11 July 1808. He was graduated at Princeton in 1754, took his M.D. at the University of Edinburgh in 1761 and engaged in practice at Philadelphia in 1762. He began the first series of lectures on anatomy given in America, at Philadelphia, in 1762, and in 1765 became professor of anatomy and surgery at the newly-established medical school at the College of Philadelphia; from 1780 until he retired in 1806 he was professor of anatomy, surgery and obstetrics at the University of Pennsylvania. In 1777-81 he was director-general of the military hospitals of the United States.

SHIPPENSBURG, Pa., borough in Cumberland County, 38 miles southwest of Harrisburg, on the Cumberland Valley, the Western Maryland and the Philadelphia and Reading railroads. The borough was settled in 1750. The Cumberland Valley State Normal School is located here. Industries include railroad machine shops and manufactures of clothing, hosiery and furniture. Pop. 3,457.

SHIPPIGAN, shīp-i-gān', Canada, a sea-port town of Gloucester County, New Brunswick at the southeastern entrance to Chaleur Bay, opposite Shippigan Island, 70 miles east of Bathurst. It is a terminus of the Intercolonial Railway system, and has steam-ferry communication with Saint George's Bay, Newfoundland. It has a fine harbor, a maritime trade and valuable fisheries. Beyond Shippigan Island, Miscou Island is frequented by sportsmen for plover, the best in Canada.

SHIPPING ARTICLES. See SEAMAN.

SHIPPING AND SHIPBUILDING TERMS. The more common terms used in shipbuilding have been gathered here for the

convenience of the student who wishes to read the articles on ship and shipbuilding.

ABEFT.—Behind, at the rear; as, abeft the beam, that is somewhat within a semi-circle to the rear of a vessel's beam. See BEAM in this article.

AFT.—At, near or toward the stern of a vessel.

AFTER PERPENDICULAR.—A vertical straight line directly aft of the rudder post.

ANCHOR.—A heavy steel or iron instrument, attached by a chain or hawser at the bow of a vessel, for dropping to the bottom and holding a ship that is not tied to a dock. It usually has a ring or shackle in the head, a longitudinal shank, and a cross arm ending in flukes. See SEA-ANCHOR in this article.

ATHWARTSHIP.—Across the ship, at right angles to the keel.

BALLAST.—Any weight or weights, as sea water, coal, pig iron, etc., placed in the lower part of a vessel to help keep her upright. A vessel without cargo usually requires ballast to prevent her being top-heavy.

BARK.—A two-masted vessel square rigged on the foremast and sloop-rigged aft.

BEAM.—An athwartship member supporting a portion of a deck; also an imaginary line at right angles to the keel; also the width of a ship; also a straight steel framing member as an I-beam.

BELOW.—To make a rope fast by turning it around a cleat.

BELOW.—Any part of a ship below a deck; the equivalent of the landsman's "down stairs."

BERTH.—A bunk or bed as for a sailor; also a place for a ship to lie.

BILGE.—The slightly rounded or flattish portion of a ship's hull, between the side and the bottom; the bulge or degree of curvature from the flat, used with reference to either the inside or outside of the hull.

BILGE KEEL.—One of a pair of miniature keels placed on the bilge of a hull. In a steel ship it is a fore and aft plate riveted to the shell. It serves to resist rolling, making the ship steadier in a rough sea.

BITTS.—Formerly, a pair of posts, now a heavy steel casting with uprights fitted to the weather deck of a vessel for attaching the mooring lines or hawsers, as towing-bitts, mooring bitts.

BLOCK.—A casing or shell having holes through which ropes are passed to change the angle of direction; especially the form called in full, a pulley-block, having one or more grooved wheels or pulleys within the casing or block. A hook or ring is usually added for attachment, and the device is the most common form of making a turn in hoisting ropes or securing increased leverage by means of different sizes of pulleys or sheaves. Compare DEAD-EYE in this article.

BOBSTAY.—A stay holding the bowsprit down to the stem.

BOOM.—A long, round, heavy spar, pivoted at the lower end, as for hoisting cargo, or holding the foot of a fore and aft sail.

BOSS.—An enlargement or curved swelling portion of a ship's hull at the point where a propeller shaft passes through.

Bow.—The forward part of a ship, also called the bows.

BRIDGE.—A platform placed athwartship above the weather deck, for the accommodation of the officers who navigate a ship.

BRIG.—A two-masted vessel, square-rigged.

BULKHEAD.—One of various vertical partitions in a ship's hull, either fore and aft or athwartships.

BULWARK.—The raised side of a ship above the weather deck, topped by a rail.

BUNKER.—A compartment low down in the hull for carrying coal or other fuel. In warships the bunkers are usually positioned so as to cover and protect the machinery or magazines.

BUOYANCY.—Ability to float; also the resulting upward pressure of water on a floating body.

CALKING.—Making tight a seam between planks, as by filling with oakum, hence tightening up any joint so as to be water-tight.

CAMBER.—A slight upward bend, especially in a timber lying athwartship; the curvature measured athwartship of deck, also called "round up."

CANT.—Something set at a slope or angle, as the cant frames—sloping ribs where a vessel's body narrows toward the bow or stern.

CAPSTAN.—An upright windlass adapted to heaving in lines.

CARLINE.—Any short fore-and-aft timber for connecting beams, or the like, as a mast carline, abutting against a mast.

CAULKING.—Closing a seam in a vessel with oakum and a chisel.

CENTREBOARD.—A vertical board or plate pivoted to swing in a well extending through a boat's bottom, as a form of drop-keel.

CENTRE LINE.—The fore and aft middle line of a vessel from stem to stern.

CHINSING.—A rough form of caulking.

CHOCK.—Originally, a block as one back of the poops, to

keep the cradle in position; now usually a heavy fitting or casting through which ropes or hawsers may be led.

CLEAT.—A heavy iron fitting attached to the deck, having a fore and aft arm around which a rope may be wound.

CLEW.—The lower corner of a square sail, or the aft lower corner of a fore-and-aft sail. Also a metal fastening or eye worked into the corner, for tying a rope.

COAMING.—The vertical edge of a hatchway or skylight; a low curb to keep out the water.

COFFER DAM.—The space between two bulkheads when placed close together; also a temporary enclosed dam.

CRADLE.—A heavy framework for supporting a vessel, as in dry dock.

CROSSPIERS.—Beams placed athwartships at the head of a mast.

CUTWATER.—A sharp-edged projection set in front of a vessel's stem where it cuts the water-line.

DAVITS.—Heavy vertical pillars with the upper ends bent to a curve, between which a boat is supported and swung on deck. The boat is loaded on the deck, and then the davits are turned so that the boat hangs overboard, when it may be lowered to the water.

DEADEYE.—A block with holes through which ropes are run after the manner of a pulley block, but without sheave or pulley.

DEADLIGHT.—A shutter for a cabin window or porthole.

DECK.—The floor of one of the levels of a vessel; also the space between such levels. The upper deck is the weather deck. Other decks are called berth-deck, half-deck, hurricane-deck, main deck, mess deck, orlop deck (just below the berth-deck), poop-deck, spar-deck, turtle-deck (an upper deck curved like a turtle's back), and wing-deck (one hanging over a paddle-box).

DISPLACEMENT.—The total weight of the water displaced by a ship when afloat, equaling the ship's gross weight with its load.

DOUBLE BOTTOM.—A vessel's bottom made in two thicknesses with a space between, leaving compartments which are used for ballast, water-tanks, fuel, oil, etc.

DRAFT.—The depth of water that a vessel draws, measured vertically from the lowest points of the hull to the surface of the water.

DRAG.—The distance which one end of a vessel's keel is above the other end, when she is not on an even keel, so called because this creates resistance or drag in going through the water.

DRY DOCK.—A dock into which a vessel may be floated, and then by removing the water leave the interior dry for repairing.

DUNNAGE.—Heavy pieces of wood or the like used to prevent cargo from rolling or shifting its position.

EVEN KEEL.—Level keel, said of a vessel lying normally level in the water.

FAIR LEAD.—The lead of a rope in a direction that will not permit it to foul or be subject to excessive friction; also a small fitting for changing the direction of a rope without causing too much friction.

FAKE.—A single turn or coil of a line, rope or cable.

FALL.—A hoisting rope depending from a block or tackle.

FENDER.—A shield-like device for hanging on a vessel's hull at the water-line, to receive the shock of contact with a dock, pier, etc.

FORE.—At, near or toward the bow, as fore-deck, fore-hook (a V-brace in a vessel's bow), foreship (the bows), fore-yard (the lowest yard of a foremast).

FORE AND AFT.—Extending or situated longitudinally of a vessel; in line with the keel.

FORECASTLE.—The forward upper part of the hull, or a compartment there; usually the quarters for the crew.

FORWARD.—The locality at, near or toward the bow.

FRAMING.—The framework or stiffening members; the skeleton of a ship.

FREEBOARD.—The part of a vessel's side that is free and clear when she is loaded, measured as the vertical distance from the upper water-tight deck or top of the bulwarks to the load water line.

FUTTOCK.—A foot-hook or curved timber in the frame of a wooden ship, extending from a floor-timber or cross-timber upward.

FUTTOCK-PLATE.—An iron plate on a mast head for holding the dead-eyes of the futtock-shrouds.

FUTTOCK-SHROUDS.—Short shrouds at the junction of a mast with its topmast.

GALLEY.—The place where the cooking is done on a vessel; the kitchen.

GANGWAY.—A passageway or opening in the bulwarks for use in boarding a ship.

GANT-LINE or GIRT-LINE.—A temporary rigging of a rope through a block at the masthead.

GARBOARD STRAKE.—The streak of shell plating next to the keel; also called sand strake.

GARNET.—A tackle or purchase, as the clew-garnet.

GASKET.—A furling line tapered for use on a yard or boom.

GIMBAL.—A support for a compass or other object which it is desired to maintain in level position, often made in pairs, and permitting the object supported to swing level regardless of a ship's rolling or pitching.

GROSS TONNAGE.—Total carrying capacity; technically, a figure obtained by dividing the total volume of the ship in cubic feet, by 100.

GUNWALE.—The side of a ship at the edge of the weather deck; specifically, the upper wale of planking or plating covering the upper end of the framing, just below the bulwarks.

HALLIARD or HALYARD.—A light rope for hoisting a sail, yard, etc.

HATCH.—A large opening through a deck, as for taking in cargo.

HAWSE.—The locality of the hawse-holes in a vessel; also the position of the mooring cables; and the space between a vessel and her anchor. The hawse-hole is a hole in a vessel's side for the passage of a hawser, and when not in use is closed with a hawse-plug. A hawse-pipe is a large fitting attached to the bow through which the anchor chain passes.

HAWSER.—A large rope, 5 to 10 inches in circumference, usually made left-handed with nine strands.

HEAD.—The forward or upper end of a vessel, mast, etc.

HEEL.—The hindermost part of a vessel, keel, mast, etc.

HELM.—The tiller; also, the tiller and rudder mechanism collectively; also the direction in which the tiller is turned, being opposite to the rudder's position.

HOGGING.—Bending strain lengthwise of a ship, tending to allow the bow and stern to settle lower than the section amidships. See **SAGGING** in this article.

HOLD.—The space below the lowest deck; the main compartment in the lower part of a vessel, for carrying cargo.

HOUNDS.—A pair of projections at a masthead, for supporting the top trestletrees and rigging.

HULL.—The body of a ship or vessel; the framing as covered with planking or plating. The term is sometimes used to include the decks.

INBOARD.—All inside a ship, toward the centre line.

INTERCOSTAL.—A space between the ribs.

JACKSTAFF.—A short flagstaff, as on the bowsprit, for flying the jack.

KEEL.—The main lower, longitudinal member of a vessel's frame, the first part laid on the ways, originally a very heavy beam, now a series of plates riveted together, and extending from stem to stern along the central line of a ship's bottom.

KEELSON.—A beam or stringer, extending over or along a keel; an auxiliary or strengthening keel-piece.

KNIGHTHEADS.—A pair of uprights supporting the bowsprit on either side.

LAUNCHING.—The sliding of a ship or boat from the launching ways on which she is constructed, into the water. Vessels are usually launched stern first, but occasionally sideways. During launching the weight of the hull is borne by the sliding ways, which are attached to the hull and slide with it down the ground ways. Much of the construction of the upper works, decoration, etc., is completed after the ship is floated. The term launch is also applied to ship's boat with sloop-sail or motor; also to a pleasure boat, as a naphtha launch.

LENGTH.—Properly the extreme longitudinal dimension of a vessel: in practice, restricted to "between perpendiculars," the length from the stem to the after perpendicular or stern post, except when expressed as "length over all," when it is measured from the forward end of the stem to the aft of the stern.

LINES.—The shape or contour of a vessel, as shown on the plans. When drawn full size on the floor of a mold loft, the templates may be made directly from them.

LONGITUDINAL.—That which extends fore and aft, especially a vertical member running practically parallel with the centre vertical keel through a double bottom.

METACENTRE.—The centre of gravity of a vessel, vertically in line with the centre of buoyancy where the vessel is upright. The higher it is above the centre of gravity, the more stable is the vessel.

MAGAZINE.—A compartment or storage room on a vessel of war for safe storage of the ammunition.

MARLINE.—A two-stranded cord or small rope for working or winding around large ropes or cables, as in splicing.

MARTINGALE.—A vertical spar under the bowsprit, a dolphin-striker; also a lower stay for a jib-boom.

MAST.—A long stick of timber or steel, placed nearly upright in the centre line of a ship, originally for carrying sails, on steamships serving for a variety of other purposes. Large masts are built up of pieces, and stepped directly on the keelson. It is common to give them a slight rake toward the stern. The principal parts of a mast are named the head (or masthead), hounding (a projection at the head to support trestle trees and rigging), housing (a hollow in a lower mast to receive a top-mast), neck and heel. A military mast is a stout upright structure carrying one or more turrets for firing small guns, and protected observation towers. The United States navy military masts are commonly made of rods arranged in open work, so constructed that they may be shot through and through frequently without falling.

MIDSHIP.—At the middle of a ship's length; also written **amidship**.

MOORING.—Securing a ship so that she is not only anchored or tied, but unable to swing with the tide or cur-

rent, called also permanent mooring. In a less restricted sense, securing a ship with two anchors so that she cannot swing much.

MOULD LOFT.—A cargo loft in which the larger parts and framing of a vessel are laid out to full size.

NET TONNAGE.—Actual available tonnage, calculated by making deduction from the gross tonnage to allow for space not available for cargo.

OAKUM.—Hemp fibre for filling seams, especially that obtained by untwisting and breaking up old ropes.

OUTBOARD.—Away from the centre line, toward the side of a ship.

OUTRIGGER.—A long float braced on one side of a canoe to give stability. Also a bracket built out from the side of a boat to hold a rowlock. Also any boom or spar braced outboard for some special purpose.

OVERHANG.—Any portion of the hull or superstructure of a vessel outside a line drawn vertically from the waterline.

PANTING.—The in and out movement of shell-plating under the influence of varying temperature, strains, etc.

PILLAR.—A column or stanchion, as for supporting the deck.

PINTLE.—A fitting or pivoted pin on the rudder, turning on a gudgeon.

POOP.—The after, upper portion of the hull of a vessel where the steering gear is commonly located. The poop deck is a short deck sometimes placed above the aft part of a spar deck.

PORT.—The left hand side of a vessel, when facing forward, opposed to starboard. Also an annular opening in the hull, or a porthole.

PROPELLER.—A device of angular blades, arranged to balance each other and rotate rapidly in the water, driving a vessel on the principle of a screw. It has almost wholly superseded the paddle-wheel because it is mechanically superior.

PUNGV.—A flat-bottomed sailboat, narrow and sharp-bowed, and usually schooner-rigged, employed on the south-eastern United States coast.

PUNT.—A flat-bottomed, square-ended, small fishing or pleasure boat, for use in shallow water, propelled by pushing it along with a pole. Hence the verb, to punt, or push along such a boat. Small barges on English canals that are propelled in the same way also bear the name.

PURCHASE.—A device for giving a leverage or turn with a rope, as a deadeye and rope, or a pulley and tackle. A double purchase is a rope rove through two single blocks and is also called a double whip. A twofold purchase consists of two double blocks, with ropes arranged to pull oppositely and thus balance. A threefold purchase employs two three-sheaved blocks.

QUARTER.—That part of the side of a vessel's stern that is aft of the main chains; also the part of a yard that is outside the slings.

QUARTER DECK.—That portion of the weather deck nearest the stern, between the poop and the mainmast. It is reserved for officers' use.

QUARTER GALLERY.—A balcony built on a vessel's quarter, often containing a washroom.

RAIL.—The balustrade on the upper edge of the bulwark.

RAKE.—Inclination from the perpendicular: applied especially to the degree of backward inclination of a vessel's masts or funnels. A craft is said to be raking when her masts or funnels have a more than ordinary lean away from the upright.

RATLINE.—A small cross-rope between the shrouds equivalent to the "rung" of a ladder.

RIG.—The style of arrangement of the ropes, sails, spars, etc., of a vessel: frequently used in compound words, as ship-rig, yacht-rig, sloop-rig, etc.

RIGGING.—The cordage or wire rope equipment of a vessel. The permanent ropes are called standing rigging and the movable ones running rigging.

RISE.—Increase of elevation; higher position.

RISE OF BOTTOM.—The amount that the flat portion of a ship's bottom is elevated above the horizontal from the keel to the side of the ship.

ROLL.—The motion of a vessel from side to side, causing an alternate raising and lowering of each side of the decks.

RUDDER.—A flat, approximately triangular structure, swinging from an upright hinged support at a vessel's stern so that all or most of the blade is under water. It is surmounted by a tiller fixed horizontally through the head, and is used for steering. The rudder of a large vessel has a complicated steering gear, power operated, and directed from a wheelhouse.

RUDDER POST.—A heavy vertical post at the after end of the stern frame, which supports the rudder.

RUDDER STOP.—A fitting to limit the swing of the rudder.

SAGGING.—A straining of the ship that tends to make the middle portion lower than the bow and stern; opposed to hogging.

SAMSON POST.—A heavy vertical post or stanchion from which a boom may be swung for handling cargo.

SCHOONER.—A two-masted vessel with fore and aft rigged sails.

SCUPPERS.—Holes in a vessel's side for the deck water to run off; hence, a drain from the edge of a deck, discharging overboard.

SEA ANCHOR.—A float, as of broken spars, lashed together and thrown out to windward from a disabled vessel to serve as a drag, that it may ride out a gale.

SHACKLE.—A form of ring for locking a porthole.

SHAFT.—A very heavy, long cylindrical steel forging for connecting the engine with the paddle-wheel or propeller.

SHAFT TUNNEL.—In a modern steamship, an enclosed alley-way containing the shaft, and running fore and aft from the engine-room to the after peak tank.

SHEAVE.—A pulley-wheel as used in a block for turning a rope. The word is primarily used for the grooved wheel, but the entire pulley-block is sometimes called a sheave.

SHEER.—Fore and aft rise of the deck lines giving curvature to the deck.

SHEER PLAN.—A side elevation of a ship's form.

SHEER STRAKE.—The upper strake of the main shell plating, just below the bulwarks.

SHEET.—A sail or piece of sail-cloth. Also one of the lower corner ropes of a sail, used for sheeting or stretching the clews.

SHEET-ANCHOR.—An emergency anchor, usually hung on either side of the waist of a ship.

SHELL PLATING.—The steel plating forming the outer skin of the hull.

SHIP.—A square-rigged sailing vessel, of three or more masts; also, a large steam-driven craft; popularly, any large floating craft.

SHROUDS.—Two or more stout ropes, often of wire, from a masthead to the rim or side of a ship, constituting a part of the standing rigging, and being supplied with ratlines serving as a rope-ladder for ascending and descending. The stay ropes or chains of a topmast or bowsprit are also sometimes termed shrouds. See **FUTTOCK-SHROUDS** in this article.

SKIDS.—Parallel timbers for protecting the side of a vessel when hoisting in cargo, etc. They are used also as dunnage.

SLING.—A stout rope or chain, for suspending a lower yard or gaff.

SLOOP.—A fore-and-aft rigged vessel with one mast.

SNUBBING-POST.—A post or pile at a pier or wharf, around which a cable can be turned, to check the motion of a vessel in landing.

SPAR.—Any round timber for supporting a sail or sails, as a mast, yard, boom, etc.

SPAR DECK.—The deck on which spars are stored, being the upper deck, and including usually both quarter deck and fore-castle.

SPRIT.—A light spar set diagonally upward from a mast to support the outer corner of a fore-and-aft sail, termed a spritsail. By this arrangement a higher sail may be carried than can be swung from the mast direct.

STABILITY.—The tendency of a ship to remain upright, resisting rolling and pitching.

STANCHION.—An upright post or supporting pillar, on a vessel.

STARBOARD.—The right hand side of a vessel when facing forward: opposed to port.

STAY.—A rope used as a tension piece to support or brace a spar.

STEALER.—A strake of shell plating that does not extend all the distance to the bow or stern.

STEM.—A nearly vertical member forming the extreme bow of a ship, formerly a very heavy timber continuation of the keelson, now a stout forging or casting running from the keel to the fore-castle deck.

STEMSON.—A curved timber or supporting member back of the stern, resting on the keelson.

STERN.—The after end of a vessel's hull.

STERN FRAME.—A large casting attached to the after end of the keel to form the ship's stern. It holds the rudder post and propeller post, and has an aperture for the propeller shaft.

STERNSON.—A curved timber or supporting member on the sternpost, being practically an upright continuation of the keelson.

STRAKE.—(The word is a corruption of streak). A fore-and-aft course or streak of shell or other plating.

STRINGER.—A fore-and-aft continuous member, for giving greater stiffening.

TACKLE.—A set of ropes, pulley-blocks, hooks, etc., constituting a hoisting equipment, as a yard-tackle.

TAFFRAIL.—A rail around a vessel's stern: formerly spelled tafferel, from the Dutch *taferel* (table) applied to the upper surface of a high stern.

TANK TOP.—The inner thickness of a ship's double bottom, as considered from the inside.

THOLES.—A pair of pins for keeping an oar in position where it crosses a boat's gunwale.

THRUST-BLOCK.—A heavy bearing for receiving the thrust or pressure of a propeller-shaft.

TIE PLATE.—A single course of plating run fore and aft under the beams of a wooden deck to strengthen the structure.

TILLER.—The arm attached horizontally to a rudder head for operating the rudder.

TRANSOM.—The aftermost transverse frame in a ship.

TRANSVERSE FRAME.—An athwartship member of a ship's framing placed approximately vertical and resembling a rib.

TREND.—Angular direction, as of a cable with the keel-line, or of an anchor-shank where it joins the arms.

TRESTLETREES.—A pair of timbers set at right angles to a lower mast, to support the top members.

TRIM.—Fit position for sailing, on even keel, with ballast, etc., properly adjusted.

TUMBLE HOME.—An inboard sloping of a vessel's side above the line of greatest beam.

UPPER DECK.—The highest complete deck.

VERTICAL KEEL.—A row of plating extending vertically along the centre of a flat plate keel. Also called centre keelson.

WAIST.—The central section of a ship, between the quarter deck and the forecastle.

WARPING.—The shifting of a floating vessel to a new position by means of a cable, (often called a warp) attached to a pile.

WATER LINE.—The lowest visible part of a ship's hull when in the water; hence, a line corresponding with such level, as the load water-line, light water-line.

WEATHER DECK.—A deck exposed to the weather having no overhead protection.

WELL.—A compartment or boxed-in space low down in a vessel's hull, as for enclosing a pump, a propeller-shaft or for holding water, etc.

WINCH.—Originally, a windlass, now a small hoisting engine.

YARD.—A spar for carrying sail, set athwartship, and the principal member of a square rig. It is nearly cylindrical, but tapers slightly toward the ends. When set obliquely, it is a lateen yard.

YARD-ARM.—The tip of a yard, of historical interest as the proper place from which to hang a pirate.

SHIPPING SUBSIDIES, in the broader economic sense, any bounty paid by a government with the object of encouraging the building and navigation of merchant ships. Under this definition would be included, and rightly so, the postal "subventions" paid by many governments for regular mail service between home and foreign ports, for the largest effect of such service is the development and maintenance of a merchant marine.

Subsidies to shipping have been classified as direct and indirect: the first where money is paid to the shipowners; the second where they are favored in other ways. Direct subsidies have been granted by various nations and at various times upon five different basic plans, as follows: (1) on the number of days of actual sailing in the year; (2) on the year's mileage; (3) on the tonnage of the vessels engaged in the trade; (4) on the tonnage as modified by speed; (5) on a scale in which tonnage, speed and the amount of cargo actually carried in the year are controlling factors. Indirect subsidies are of great variety, including government loans at low interest to shipbuilders; free registry; bounties to certain industries which produce export goods; remission or reimbursement of canal and port dues; restriction of coastal trade to domestic shipping, etc.

Most of the maritime nations have adopted the principle of shipping subsidies. France has given the most money, but without the increase in her merchant marine that such expenditure might be expected to induce. At the beginning of the European War, Japan was paying out in subsidies annually about \$7,000,000; and Japan's merchant fleet has grown and prospered exceedingly, but so many other factors are to be considered that it is an open question whether the system of subsidies is to be given the credit. On the other hand, Great Britain has built up by far the largest of all national merchant marines without subsidies. The methods employed by the several countries

in recent years in fostering their merchant fleets are arranged below in alphabetical order.

Austria.—Trade bounties; depreciation bounties; naval bounties; exemption from trade and income taxes; mail subventions; reimbursements of Suez Canal dues.

Belgium.—Before the war subsidies were granted to German steamship lines to prevent them from forsaking the port of Antwerp. In June 1916 the government entered into agreement with the Royal Belgium Lloyd under which it guarantees interest on loans and mortgages to the extent of 100,000,000 francs in aid of the establishment of a Belgian merchant marine independent of all foreign influence.

Denmark grants an annual subsidy to one steamship company operating a line to British ports. There is a reimbursement to shipbuilders of 2 per cent of the duties collected on materials actually used in domestic shipyards. Postal subventions are small.

France.—Construction bounties per gross registered ton, and in case of the installation of new machinery, an allowance based on the weight of the new work, navigation bounties to steamships not above 3,000 tons and having a speed not less than 10 knots, and to sailing vessels; postal subventions to colonial lines, based on regular service carried on by vessels of stated speed. The French government has recently voted a fund of 160,000,000 francs for loans to shipbuilders to aid in rebuilding the ships lost in the war.

Germany.—Yearly, mileage and speed subsidies to ships built of German materials in German shipyards, and special subsidies to lines running to North and South American ports and to East Africa. Indirect aid was given by preferential rates on government-owned railways and through the control of emigration, which was turned to the German lines.

Great Britain.—No direct subsidies; moderate mail subventions are granted to lines operating under postal contracts.

Holland.—Lower rates of duty assessed on imports brought in on Dutch ships; annual postal and colonial subventions.

Italy.—For years it has refunded to steamers the sums paid for Suez and Corinth Canal dues and has paid bounties on all coal brought from beyond Gibraltar; a mileage subsidy to Italian-owned vessels operating in the Mediterranean and beyond Suez. Besides the regular postal subventions, a speed bounty is paid to all ships of 16 knots or above. Since 1914 shipbuilding materials have been on the free list and a bonus has been granted to shipbuilders. Recent laws exempt Italian subjects from tax for three years on steel vessels purchased and for four years on those built in Italy. Brazil contributes an annual subsidy to Italian lines touching her ports, with the object of encouraging Italian immigration to the coffee districts.

Japan.—Reserves coasting trade to Japanese ships operated by Japanese companies; shipbuilding bounties and navigation bounties; special subsidies to speedy vessels to Pacific Coast ports and to South American ports and to a line using the Panama Canal with a New York terminus.

Norway.—Reimbursement of import duties paid on foreign materials actually used in Norwegian shipyards for building or repair; subsidies to Norwegian steamship companies

maintaining service on non-paying routes; subsidies to vessels in the coasting trade; mail subventions; tonnage refund on vessels built in Norwegian yards of Norwegian materials.

Russia.—Reservation of coasting trade to Russian vessels; loans to steamship companies; exemption from customs charges to ocean-going vessels owned by Russians; bounties on ocean liners and inland river steamers; reimbursement of Suez Canal dues.

Spain.—Navigation bounties to Spanish ships manned by Spanish crews, based on actual mileage per ton gross; construction subsidies per gross registered ton, with an additional 10 per cent for each knot of speed above 14; postal subventions; a levy of one-third the bounty in case a Spanish vessel was sold abroad.

Sweden.—Refund of duties paid on construction and repair material used in Swedish shipyards; loans to steamship companies at low rates of interest; mail subventions. A new policy under discussion providing direct subsidies (1918).

United States.—Coasting trade reserved to American ships; heavy mail subventions. The government program as to ships built during the war and subsequently in government yards is not yet (1919) matured. The proposed charging off of a cost factor of \$1,000,000,000 against such vessels would be in effect a subsidy to the purchasers of such ships.

In the United States the first act authorizing postal subventions was that of 3 March 1845. Power was given to the Postmaster-General to make contracts for payments of specified rates on weight of mail carried to foreign ports—24 cents per half ounce for ports 3,000 miles distant; 10 cents per half ounce to Mexico and the West Indies. In 1847 a contract was made with the Ocean Steam Navigation Company for a mail service between New York and Bremen and Havre. The company was to receive \$100,000 for six return voyages to Bremen per year and \$75,000 for six voyages to Havre. In 1850 the Collins Line, plying to Liverpool, agreed to accept \$19,250 per voyage, making 20 voyages a year. A number of similar contracts were made about the same time, but in 1858 the granting of mail subventions was abandoned and vessels carrying the mails were allowed only the sea postage plus the inland postage on mails carried. Postal subventions were allowed to lines running between New York and Rio de Janeiro and between the Pacific Coast and China, but were discontinued in 1875 after running 10 years. In 1891 a law was enacted authorizing the Postmaster-General to make contracts with American shipowners for carrying the mails between American and foreign ports. Steamships were placed in four classes: iron and steel vessels of not less than 8,000 tons with a speed of 20 knots per hour; iron and steel vessels of not less than 5,000 tons, with a speed of 16 knots; iron and steel ships of not less than 2,500 tons and a speed of 14 knots; iron, steel and wooden ships of not less than 1,500 tons and a speed of 12 knots. This law is still in force. The most that may be paid for carrying the mails is \$4, \$2, \$1 and 60c per mile sailed for the respective classes. The requirement is that contracts be let to the lowest bidder.

In spite of the persistent agitation of the shipping interests a general objection to all ship subsidies has prevailed in this country. It has been pointed out that American shipping on the high seas is constantly declining. In 1905 the total tonnage of the United States engaged in foreign trade was only 943,750 as contrasted with 2,496,894 tons in 1861, while the tonnage of foreign nations has constantly increased. Without government subsidies it has been contended that the costs of construction and operation are heavier in America than elsewhere. Since 1840 the United Kingdom has granted liberal subventions for carrying the mails, while in America no action was taken until 1891 when the existing law was passed, though bills for granting subsidies have been constantly before Congress. Consult Bacon, E. M., 'Manual of Ship Subsidies' (Chicago 1911); Clifford, C. A., 'Selected Articles on Ship Subsidy' (Minneapolis 1913); Dunmore, W. T., 'Ship Subsidies' (Boston 1907); Marvin, W. L., 'The American Merchant Marine' (New York 1902); Meeker, R., 'History of Shipping Subsidies' (New York 1905); Renninger, W. D., 'Government Policy in Aid of American Shipping' (Philadelphia 1911).

SHIPPING OF THE WORLD. When the Great War broke out in 1914, the world's shipping had reached its greatest known proportions. The year 1913 had been a record year in shipbuilding with nearly all the maritime nations. Great Britain had launched 641 steamers aggregating 1,919,578 tons and 47 sailing vessels aggregating 12,575 tons, the highest figure ever recorded for a year's output of tonnage in that country. Not all of this tonnage went to swell the numbers of the British fleet. Holland bought 89,992 tons; Norway, 54,111 tons; Greece, 39,999 tons; the British colonies, 37,118 tons, and Russia, 31,217 tons. With the exception of the United States, whose output of shipping for the year fell short of her 1912 figures by some 8,000 tons (due to a decrease of 42,000 tons in the yards of the Great Lakes), and slight decreases from previous record figures in France and Japan, all the other shipbuilding countries made substantial gains over their previous records. During 1913, then, the new ships launched had added 3,188,578 tons in steamers and 144,304 tons in sailing vessels to the world's grand fleet. The previous high record had been 2,919,763 tons (steam and sail combined) in 1906, and the average yearly addition to the world's fleet for 20 years past had been 2,341,500 tons. However, the yearly additions were not all clear gain. The losses in 1913 from collision, burning, foundering, wrecks, missing and abandonment at sea, together with those of vessels broken up as unseaworthy, amounted to 499,000 tons of steam vessels and 183,000 tons of sailing vessels, so that the net addition to the world's shipping in 1913 was 2,690,000 tons of steamers, and there was a net loss of 39,000 tons of sailing craft. This figure was very small by comparison with the losses of other years. In 1910 the tonnage lost amounted to 947,690 tons, and the average annual loss for 20 years had been 765,000 tons.

For a long period of years the tendency in the world's grand fleet has been an increase of steam vessels and a decrease of sailing vessels. The one exception has been Finland, whose

persistent building of sailing ships has prevented any notable decrease in the sailing tonnage in Russia's shipping. Norway's sailing tonnage has been declining since 1890; Sweden's since 1880; Denmark's since 1880; Germany's since 1880; Holland's since 1860; France's since 1860; Italy's since 1870; Austria-Hungary's since 1870; Greece's since 1870. In the case of the United Kingdom the date was 1870 and for the United States 1861. Not to go farther back than 1900, the percentage of sailing vessels in the world's grand fleet was 23 per cent; in 1915 it had been fallen to 7 per cent.

The world's shipping on 30 June 1914, as recorded by the French Bureau Veritas, totaled 17,135 steamers of 100 tons or over, aggregating 23,840,675 net tons; and 21,924 sailing vessels of 50 tons and upward, aggregating 5,629,942 net tons; a grand total of 29,470,617 net tons—also recorded as 45,273,783 gross tons, a figure also of no small importance, as the sinkings by submarines are reported on the basis of the gross tonnage; the net tonnage being the vital figure in the carrying capacity of the grand fleet.

Table A, showing the distribution of 99.7 per cent of the world's grand fleet, was compiled from the records of the Bureau Veritas. The 26 countries named are arranged in the order of their steam tonnage. Only steam vessels of 100 net tons and over and only the sailing vessels of 50 net tons and upward have been counted. Many highly interesting facts appear from the figures in the table, among them the very large tonnage in sailing vessels, both actual and comparative, owned in the United States in the year cited. Though Great Britain shows a much larger number of such craft, their tonnage averages only 190 tons as against 420 tons for the United States vessels. Norway's sailing fleet is notable in showing the

largest average tonnage in the table—750 tons; Belgium following with 730 tons and Peru third on that score, with 540 tons. The largest average tonnage for steam vessels is shown by Germany—1,880 tons; followed by Austria-Hungary, 1,800 tons; Netherlands, 1,740 tons, and Great Britain, 1,640 tons.

With the breaking out of the war in July 1914 the destruction by war vessels of the merchant fleets of the belligerents began, and this destruction on the part of Germany and her allies was soon extended to include the shipping of neutrals carrying contraband, few attempts being made to capture them. In February 1917 the German government declared promiscuous war on all merchant vessels of whatever country found in certain specified areas of the open sea. This condition had already prevailed in some waters for several months previous to the declaration, and many vessels were sunk outside of the forbidden areas, and even those bearing safe conduct from Germany and in the so-called "safe" channels met the same fate. The records of losses from these causes stop with April 1917, at which time the British government ceased the publication of tonnage lost, and gave thenceforth only the number of vessels lost from week to week. A carefully worked-out summary of the losses by mine and submarine from 8 Aug. 1914 to 26 April 1917 shows a total of close to 5,740,000 tons, of which 1,653,654 tons belonged to neutral nations. Of the neutrals, Norway had suffered the most, losing 436 vessels, aggregating 987,816 tons; Holland came next, with a loss of 76 vessels of 148,921 tons. Greece lost 60 ships aggregating 147,923 tons, and Denmark 114 ships, aggregating 123,385 tons.

Table B is introduced to show by the latest complete figures available the condition of the world's shipping at the date given, as it is compiled from records of the Bureau Veritas. The

showing is that after three years of the most destructive warfare the world has ever seen, the world's grand fleet consisted of 17,135 steamers aggregating 25,550,159 net tons, and 19,985 sailing vessels aggregating 4,731,707 tons. At their face these figures seem to show the same number of steamers and a gain of 1,710-484 tons of steam tonnage; and a loss of 1,939 in the number of sailing vessels, with a loss of 898,235 tons of sailing tonnage. This is not quite in accordance with the facts. Many of the sailing vessels apparently lost have been fitted with steam or gasoline engines and have thus passed into the class of "steamers." In taking account of the world's tonnage it is to be remembered that under normal conditions the yearly addition to the grand fleet would have been the average previously quoted—2,341,500 tons per year. In three years the total addition would have been 7,024,500 tons, instead of the showing for 30 June 1917 of a net gain of 812,249 tons—revealing a net loss due to the war of 6,212,251 tons; a figure not very far removed from the actual losses recorded up to 26 April of that year.

A studious comparison of the two tables shows losses in steam tonnage by Germany, Sweden, Austria-Hungary, Spain, Greece, Belgium, Brazil, Argentine Republic, China, Chile, Turkey, Cuba, Uruguay, Mexico and Peru; and gains by Great Britain, United States, Norway, Japan, France, Italy, Netherlands, Russia, Denmark, Portugal and Rumania. With the exception of Germany, Austria-Hungary and Turkey, whose losses represent vessels seized by belligerents, or, in the case of Turkey, by destruction in warfare, the apparent losses do not show destruction but indicate sales of shipping to the principal allies fighting against the Central Powers. The large reduction of the sailing tonnage of the United States is accounted for by the installation of power, placing them in the steamer class. Another very large factor to be considered in making comparisons is that the allied nations opposing the Central Powers have withdrawn from their merchant fleets a prodigious amount of tonnage for military purposes, and this no longer appears in the columns of these tables. Of Germany's and Austria-Hungary's ships in foreign ports many have been seized, at a loss to them of not less than 1,000,000 tons. The United States alone took over 636,036 tons. Figures issued by the United States Shipping Board in March 1919 place the world's steam tonnage at 37,010,000 gross tons; the net loss due to the war at 4,245,000 gross tons—which includes 1,000,000 tons as "abandoned"; and the further loss of the increase to have been normally expected, at 12,000,000 tons: making the world shortage attributable to the war, 16,245,000 tons on the date cited.

When the armistice was signed 11 Nov. 1918 the United States had a merchant marine of 1,366 steamers aggregating 4,685,263 gross tons, and 747 sailing vessels aggregating 829,919 gross tons; a combined total of 5,515,182 gross tons, as compared with 2,696,763 tons in 1914—a gain of over 125 per cent. From such figures as are available Table C has been compiled showing the losses, replacements, and existing merchant tonnage on 1 Jan. 1919 of the principal maritime countries of the world. See MERCHANT MARINE OF THE UNITED STATES.

TABLE C.—WAR LOSSES, REPLACEMENTS AND MERCHANT TONNAGE OF THE WORLD, 1 JAN. 1919. (ESTIMATED IN PART.)

COUNTRY	Losses (tons)	Replacements (tons)	1919 Tonnage
Great Britain	7,743,746	8,900,000	15,007,000
United States	381,987	4,100,000	5,515,182
Germany	2,706,000	950,000	1,385,000
Japan	117,470	825,000	2,318,000
Netherlands	109,015	560,000	1,807,000
Norway	1,178,435	773,000	1,587,000
France	607,468	423,000	1,443,000
Italy	854,174	373,000	1,200,000
Spain	167,633	250,000	890,000
Sweden	201,733	70,000	804,000
Austria-Hungary	390,000	75,000	717,000
Denmark	239,922	95,000	615,000
Russia and Finland	183,857	25,000	590,000
Brazil	25,468	240,000	507,000
Chile	10,000	320,000	406,000
Greece	337,345	—	331,000
Portugal	82,327	230,000	362,000
Argentina	4,273	64,000	241,000
Belgium	166,000	—	173,000
China	13,000	40,000	118,000
Cuba	10,000	30,000	78,000
Mexico	3,000	27,000	71,000
Uruguay	9,480	60,000	60,000
Peru	1,419	43,000	67,000
Turkey	60,000	—	56,000
Rumania	3,688	—	51,000

RICHARD FERRIS.

SHIPS, Registration of. See MARITIME LAW.

SHIPS THAT PASS IN THE NIGHT, the title of a widely-read story by Beatrice Harraden. It achieved notoriety when it was published in 1894 to some extent, very possibly on account of its taking title. The scene is laid in a Swiss winter resort for consumptives.

SHIPTON, ship'ton, Mother, an English prophetess about whose existence there seems to be no certainty, while there is no doubt that many of the sayings attributed to her were fabricated by others. According to S. Baker, who published Mother Shipton's pretended prophecies in 1797, she was born near Knaresborough, Yorkshire, in July 1488, and baptized as Ursula Southlie. She died, according to the same authority, at over 70 years of age, but it was not until 1641 that a pamphlet appeared containing some of her alleged predictions. In 1645 all her prophecies were considered as having been fulfilled. In 1862 a prediction was made, with Mother Shipton's name appended to it, that the world would come to an end in 1881. It caused some excitement among the ignorant.

SHIPWORM. See TEREDO.

SHIPWRECKS. See DISASTERS OF THE WORLD, NOTABLE.

SHIR ALI KHAN, shēr ā'le khān, Amir of Afghanistan: b. about 1825; d. Mazar-i-Sherif, 21 Feb. 1879. He was the younger son by a favorite wife of Dost Mohammed and was nominated successor to the throne to the exclusion of Mohammed Afzal Khan, the eldest son by another wife. Dost Mohammed died in 1863 and a fratricidal war ensued to determine the succession. In December 1863 Shir Ali secured the recognition of the British government to his succession, and in the contest that followed Mohammed Afzal was taken prisoner. The brother and son of the latter, who retained possession of Afghan-Turkestan, renewed the war and in a battle which took place in May

1866 the majority of Shir Ali's troops deserted to the enemy. For the next three years Shir Ali's fortunes ebbed and flowed and at times he seemed likely to lose his throne forever. In 1869, however, with the recognition of the British he was fully established on the throne at Kabul. In 1877 he became estranged from the British government, and refused to receive a British mission at Kabul. At the same time he made overtures to Russia and received her mission, while relations between Russia and Great Britain were strained. The British mission being a second time repulsed, war was declared and the British invaded Afghanistan. Shir Ali fled at the approach of the British and determined upon making personal appeal at Petrograd for an alliance against the British. The Russian government sent him messages declining to enter into any such alliance, but he persisted in his journey until he had crossed the Russian frontier, where he died suddenly. See **AFGHANISTAN**.

SHIRAS, shī'ras, George, Jr., American jurist: b. Pittsburgh, Pa., 26 Jan. 1832. He was graduated from Yale in 1853 and from the Yale Law School the next year. Received the degree of LL.D. from Yale in 1883. Admitted to the bar in his native city in 1856 he practised there until in July 1892 he was appointed associate justice of the United States Supreme Court. Retired 1 March 1903 on age limit.

SHIRĀZ, shē'rāz, Persia, capital of the province of Fars, lies in a high valley, 220 miles southwest of Ispahan, and is reached by lofty passes. It lies in a broad plain, 115 miles east-northeast of Bushire and 35 miles southwest of the ancient Persepolis, the ruins of which still exist. Its nearest point is Kōdijān. It is much praised in Persian poetry for its climate, its wine and rose-gardens. The city, with thousands of the inhabitants, was nearly destroyed for the third time in its history in 1853 by earthquake. The town now rebuilt contains mosques, a bazar, but nothing noteworthy; the suburbs are more attractive. At the north are the tombs of the celebrated poets Hafiz and Sadi, both natives of the town. It is a centre of trade, due to its position on the commercial routes leading from the port of Bushire. Shirāz is famous for its wines and inlaid work of wood and metals. It has extensive manufactures of silk and cotton, firearms, cutlery, glass, pottery, swords, etc. Pop. 40,000.

SHIRÉ, shē'rā, East Africa, a river in the southeastern part of the continent. It rises in Lake Nyassa, and, after a course of 370 miles, flows into the Zambesi. It is navigable except where interrupted for 35 miles by the Murchison cataract and rapids, which have a fall of 1,200 feet. It flows through a rich agricultural country and has become an important commercial route to the lakes region. The Shiré Highlands are included in Nyasaland. There are several Scotch and English missions and settlements in the Shiré country. Cotton and grain are the chief products. The Shiré was discovered by Livingstone (1858-63), and the district was annexed as British territory in 1889. Consult Buchanan, J., 'The Shiré Highlands' (1885).

SHIRE, shēr or shir, in the United States the more modern term county replaces this

older name. Shire is an English term, still in general use in England, Wales and Scotland, although superseded by the modern form in most places; thus Derbyshire, Glamorganshire and Renfrewshire are "counties." In the United States counties are the first division of the State and township the next. The use of the word shire in the States has no significance as to division; it is merely a portion of a name. Thus we have the "county of Yorkshire." But in England this is different. The suffix "shire" so used is in itself an indication that the division is a county.

There have been stated different periods at which, it is said, England was divided into shires. It is probable that all such statements are incorrect, and that although there exists in England a system of subdivisions known as shires, the country perhaps never was consciously so divided. If it be remembered that the Saxon people were a collection of clans and that these clans were divided into families, two or three large families to the clan, the seeming inconsistency of the above statement is explained. The head of the family was the supreme law-giver in the family. He himself was under the leadership of the head of the clan, or tribal community. These tribal communities united to form what is known as hundreds, and the hundreds united to form shires. Thus the country instead of being divided into shires was formed by the union of many separate shires, each of which was, practically, an independent kingdom. Some of these small districts still exist—Norhamshire in Northumberland and Richmondshire in Yorkshire. It was after this union of shires under one national head, not a spontaneous process, but one of slow and at times retrogradal growth, that the shire took its position as a subordinate part of the kingdom. As such it had at its head the shire-reeves, whence the modern sheriff. The shire-reeve preceding the Norman Conquest was one of the two heads of the shire organizations, the other being the ealdorman (or earl), whence comes our modern alderman. The ealdorman seemed to represent the old organization and dignity of the shire when it was an independent kingdom; he shared certain offices with the bishop. But the shire-reeve was more particularly the representative of the king, and after the Norman Conquest he became purely a royal officer, with his importance considerably curtailed. He held the sheriff's tourn, an annual court to which came the vassals of the king. The appeal from this court was to the king himself, and from this appeal came the growth of the King's Court, in its three branches of King's Bench, Common Pleas and Exchequer. This court assessed taxes, also, and thus the sheriff became the financial head of the shire; to the Sheriff's Court, too, fell the election of knights of the shire, thus giving it the function of an assembly for the choice of shire representatives. From the time of the Plantagenet accession to the throne the importance of the shire organization decreased, the sheriff now being merely an aid to the County Court (q.v.). (See **COUNTY**; **FEUDAL SYSTEM**). Consult J. R. Green's 'History of the English People,' Vol. I (1870-82); 'Conquest of England' (1884); 'The Making of England' (1885); Freeman's 'Norman Conquest,' Vol. I, chs. ii-iv (1870).

SHIRLAW, shēr'lā, **Walter**, American painter: b. Paisley, Scotland, 6 Aug. 1838; d. Madrid, 1909. He was brought to the United States in his second year, and began his artistic career in early manhood as a bank-note engraver. He exhibited for the first time in the National Academy of Design in 1861. After a course of seven years' study in Munich (1870-78) he adopted genre-painting as his specialty, and also accomplished a great deal of work in decoration and book and magazine illustration. He was one of the founders and the first president of the Society of American Artists, and in 1888 he became a National Academician. A memorial exhibition of 200 of his works was held in New York and other cities in 1911.

SHIRLEY, shēr'li, **James**, English dramatist: b. London, 18 Sept. 1596; d. there, 29 Oct. 1666. He was educated at Oxford and Cambridge, and, having taken holy orders, obtained a curacy near Saint Albans. He soon afterward went over to the Church of Rome. Then he removed to London, became a writer for the stage and acquired a reputation which caused him to be taken into the service of Queen Henrietta Maria. His first comedy was licensed in 1625, and from that date he produced many plays in rapid succession. In 1636 he went to Ireland to assist Ogilby in the management of the new theatre at Dublin. After his return, probably early in 1640, he wrote much, and was conceded the foremost of English playwrights. He died of exposure during the great fire. He was last of the notable series of Elizabethan and Jacobean playwrights; and his works, while frequently thin in plot and loosely constructed, are clever, suave and abounding in fancy. Besides 37 tragedies and comedies, he published a volume of poems. His best dramas are the tragedies 'The Traitor,' 'The Royal Master' and 'The Cardinal,' and the comedies 'Hyde Park,' 'The Ball,' 'The Gamester' and 'The Imposture.' The best edition of his dramatic works is that by Gifford and Dyce (1833). Consult Wood, 'Athenæ Oxonienses,' (ed. Bliss; 1817); Ward, 'History of English Dramatic Literature' (1875); Forsythe, R. S., 'Relations of Shirley's Plays to the Elizabethan Drama' (New York 1914); Nason, A. H., 'James Shirley, Dramatist: A Biographical and Critical Study' (New York 1915); Parlin, H. T., 'A Study in Shirley's Comedies of London Life' (University of Texas 1914).

SHIRLEY, **William**, American colonial governor: b. Preston, Sussex, 1693; d. Roxbury, Mass., 24 March 1771. He studied law and in 1731 came to America, settled in Boston, Mass., and there engaged in that profession. He was royal governor of Massachusetts in 1741-45, planned the successful expedition against Cape Breton in 1745, and in 1745-53 was in England, after which he returned to Massachusetts as governor. He made a treaty with the Eastern Indians in 1754, explored the Kennebec River, and erected several forts on its banks, and at the outbreak of the French War in 1755 was commander-in-chief of the British forces in North America. He planned the expedition of General Prideaux against Niagara and accompanied it as far as Oswego, but was superseded in his military command and in his governorship in 1756. He was later appointed governor of the Bahamas, a post he resigned in 1770, and

then returned to Massachusetts, where he lived in retirement the remainder of his life. He wrote 'Electra,' a tragedy; 'Bertha,' a masque; 'The Siege of Louisburg' (1745); 'Conduct of Gen. William Shirley Briefly Stated' (1758), etc. Consult 'Correspondence of William Shirley' (New York 1912).

SHIRLEY, a novel by Charlotte Brontë, published in 1849. The scene is laid in the Yorkshire country, with which the author had been acquainted from childhood. The heroine, Shirley, was drawn from her own sister Emily. The book is richer in portrayal of character than in striking incident.

SHIRREFF, shīr'ēf, **Emily Anne Eliza**, English pioneer educator of women: b. 3 Nov. 1814; d. London, 20 March 1897. She was a daughter of Rear-Admiral Shirreff and with her sister Maria—afterward Mrs. William Grey—received an excellent education, especially in languages and history. The inadequacy of educational facilities for women impressed the sisters deeply and their first efforts to improve matters lay through the publication of several books of which they were joint authors. These include 'Letters from Spain and Barbary' (1835 or 1836); 'Passion and Principle,' a novel (1841); 'Thoughts on Self-Culture, Addressed to Women' (1850). Miss Shirreff was a staunch supporter of the movement to establish Girton College, and was honorary mistress there in 1870, as well as being a member of the executive committee until her death. With her sister she founded the National Union for Improving the Education of Women of all Classes out of which in 1877 came the college for women now known as the Maria Grey Training College. She was an advocate of the Froebel system, concerning which she wrote several pamphlets. She was also author of 'Intellectual Education and its Influence on the Character and Happiness of Women' (1858).

SHISHAK, shī'shāk, Egyptian king, the Sheshenk I of the monuments, and the first sovereign of the Bubastite or Libyan dynasty. Shishak I rose to the throne from being commander of the powerful Libyan mercenaries; to him Jeroboam fled for protection when he fell under the suspicion of Solomon (1 Kings xi, 40); and in the fifth year of Rehoboam he invaded Judah, whose fenced cities he took one after another until he arrived at Jerusalem which, according to the statements of Josephus, fell without a struggle. (Compare 2 Chron. xiii, 1-10). Shishak pillaged the temple and the king's palace, carrying off the treasures accumulated in the reigns of Solomon and David, and reducing Judah to the position of a tributary kingdom. He ascended the throne of Egypt about 980 B.C. and reigned at least 21 years. On the southern wall of the great temple of Karnak, in Upper Egypt, is a record of the conquests of Shishak and of the countries ruled by him. On this are four rows of prisoners. Each figure has his arms tied behind him, and a rope around his neck, and Shishak, a colossal figure, leads them by a string, meanwhile brandishing a weapon. In the lists of his conquests during the expedition in which Judah was subjected to his rule we find the names of cities in both the kingdoms of

Israel and Judah and of several Arabian tribes to the south of Palestine. Among those of the cities which can be recognized in these lists are Rabboth, Taanach, Sunem, Rehob, Hap-haraim Adoraim, Mahanaim, Gibeon, Beth-Horon, Kedemoth, Ajalon, Megiddo and Judah Maluk, "the royal city of Judah," or Jerusalem. Shishak appears to have been one of the ablest and most powerful of the Egyptian monarchs. All Egypt was under his sway. Consult Müller, W. M., 'Egyptological Researches' (Washington 1906).

SHITTIM WOOD. See KITTIM.

SHIVAISM, the religion of the Shivaïtes, or worshippers of Shiva or Siva, an ancient Dravidian divinity of southern India. His proper name was Mahādēwa, "greater god"; but the title Shiva, "the good," was more generally applied to him by his votaries. While Shiva is the most popular of the Hindu pantheon, his worship more widely obtains in the south than in the north, although his throne is the Himalayas, and he is a destroying god, yet sometimes restoring and fructifying in influence. Thus in the south he is widely honored under the symbol of the phallus or lingam. Although he is a Dravidian god, in the struggle between Brahmanism and Buddhism he was adopted into the Brahmanistic system and identified with the Vedic Rudra, god of storms. Consult Barnett, L. D., 'Antiquities of India' (London 1913); Hopkins, E. W., 'Religions of India' (Boston 1895); Macdonnell, A. A., 'Vedic Mythology' (Strassburg 1898).

SHIVELY, Benjamin Franklin, American lawyer and senator; b. Saint Joseph County, Ind., 20 March 1857; d. 14 March 1916. He was graduated at the University of Michigan in 1886, and engaged in law practice at South Bend, Ind. He served in Congress in 1884-85 and in 1887-93. He was elected to the United States Senate for the term 1909-15 but died before its expiration.

SHOA, shō'ā, Abyssinia, northeast Africa, an important southern province, before 1889 a separate kingdom, with ill-defined boundaries. It consists of a series of plateaus at 3,000 feet above sea-level, traversed by mountain chains, which, in the culminating point, Mount Metatite, near Ankobar, have a height of 10,700 feet. Its east portion, called Effat, has a less elevated and more generally sloping surface, which is highly cultivated, and yields good crops of grain, chiefly wheat and barley. Cotton also is extensively cultivated. The higher plateaus are devoted to pasture. Among indigenous trees is the *Juniperus excelsa*, which in the course of a century attains a height of 160 feet, with a diameter at the base of four to five feet. The exports of the province comprise grain and large quantities of a durable cotton cloth, and to these may be added, as articles of trade, coffee, gold-dust, ivory, gums and spices, ostrich feathers, hides, dye-woods, medicinal plants, etc. The present capital is Adis Abeba, but the chief town is Ankobar. Christianity was introduced as early as the 3d century, and is still professed by a large number of the inhabitants, though in a degenerate form. Pop. estimated at 2,500,000 of whom about 1,000,000 are Christians and the rest chiefly Mohammedans.

SHOALS, Isles of. See ISLES OF SHOALS.

SHOCK, a sudden vital depression of the body usually due to sudden derangement of the functions of the nervous system, and generally accompanied by a dilatation of the blood-vessels of the surface of the body and a marked decrease in blood-pressure. Such a condition may be brought about by both physically or psychically acting causes. A blow, a fall, a hæmorrhage, an operation, sudden fright, an appalling sight, a heartrending cry, sudden financial loss or great and sudden bereavement are among the many causes constantly acting to bring about such a condition. The symptoms of shock vary greatly according to the type of cause and the individuality of the patient. Sometimes the symptoms begin at once; under other circumstances the results may be delayed for a long period. A very severe form of shock is spoken of as surgical shock. This usually results from serious operations which involve nervous structures, take much time, and large quantities of anæsthetic. A condition closely resembling surgical shock may follow the severe hæmorrhage of placenta prævia, ectopic pregnancy, or other form of internal hæmorrhage. (See BLEEDING). Special types of shock develop from the violent action of heavy explosions in war. These affect the central nervous system and were extremely frequent in the Great War of 1914-18. The symptoms of shock are very characteristic. The face usually becomes blanched and pale, the body becomes cold and is covered with clammy perspiration, the hands and feet usually become icy, the brain seems to be in a whirl, and consciousness is lost or much clouded. The pulse is usually quickened; the arteries at the wrist are soft and easily compressed; the breathing is usually rapid and shallow, labored, and at times irregular. The eyes are often sunken and listless, and the temperature of the body is diminished one or two degrees. The most important single factor in pure shock of the type described is the sudden fall in blood-pressure. This is thought to be due to purely nervous causes, the most potent one of which is paralysis of the sympathetic nervous fibres. This causes sudden dilatation of the blood-vessels, loss of tone of the vessel-walls, with loss of blood-pressure; hence the symptoms, and oftentimes the resultant death. The action in the sympathetic nervous system is largely due to the implication of the suprarenal glands, and other glands of internal secretion. Sometimes the symptoms of shock are much less severe. There is temporary faintness, slight pallor and a feeling of nausea, and the attack passes off. Between this slight shock and the shock that results from the pugilist's "solar-plexus" blow, that may bring death, every variety of change may be noted. In severe accidents many patients, while not suffering from physical injury, are often prostrated and develop true railroad shock, or traumatic neurasthenia. (See NEURASTHENIA). Psychological shock may induce neurasthenia; it may be a potent cause of mental disease; or it may even cause death. The influence of shock upon pregnant women is of great importance. Shock in such circumstances may bring about miscarriage, or cause malformations of the foetus. Mild cases of shock are recovered from without aid. A stage of reaction sets in, the patient becomes warmer, the blood-vessels

regain their tone, and equilibrium is restored. More severe attacks require hot-water applications to the extremities, hot tea or coffee by mouth, alcoholic stimulants, or even ergot or adrenalin. Massage and heat, and sometimes rectal injections of plain hot (110°–115° F.) water, or hot salt water (1 teaspoonful of salt to pint of water) are very useful in extreme cases.

SHOCK ABSORBERS. Even when vehicle springs have been carefully selected with due regard to the loads they are to carry, it is difficult to provide against the many variations in loads and speed that necessarily obtain under conditions of actual service. In automobiles especially it is found that a car which rides easily on good roads often proves decidedly uncomfortable on rough roads because the light springs cause the riders to be jostled about at any but the slowest rate of speed. To aid the springs and effect a compromise, shock absorbers have been devised. They are of various designs and are all intended to supplement the action of the vehicle springs. Two general divisions of absorbers may be noted, however, those which receive shocks caused by a sudden deflection of the spring and those which merely check excessive motion of the spring by what may be considered a variety of brake action. A very simple form of absorber is a rubber pad carried by a clip and attached at the centre of the spring, where on the chassis is fixed a bolt or bracket which, upon the sudden deflection of the spring, rests the frame and load upon the rubber buffer or pad. Another form of absorber is the auxiliary spring, usually a spiral, and designed to operate in conjunction with the main springs. Its function is to retard excessive motion of the latter. Absorbers of the brake action type consist usually of a pair of levers hinged together at one end and the other end attached to chassis and spring, respectively. A variety of this form has a cup and cam hinge, with steel springs inserted in the cup and pushing against the cam. Other designs of absorber consist of cylinders filled with oil and fitted with a piston and plunger rod. One member of these cylinder absorbers is of course attached to the frame or chassis while the other is attached to the axle. The piston acts as a check to any rapid movement of the plunger rod.

SHOE. See **BOOTS AND SHOES**; **SHOE INDUSTRY IN THE UNITED STATES.**

SHOE-BILLED STORK, or WHALE-HEAD, a large stork (*Balaniceps rex*) found on the White Nile. It is brownish-gray with black wings, tail and feet, the head is slightly crested, the bill short, broad and deep, with the tip hooked and mottled dusky and yellow. These birds, also known as "boat-bills," live in flocks in swampy woods and morasses, and feed upon all kinds of small reptiles, frogs, fish, mollusks and carrion. Although they perch upon trees, the nest is on the ground, a slight lining of grass, etc., in a slight hollow. The eggs are white and from 2 to 10 in number.

SHOE INDUSTRY IN THE UNITED STATES. History.—Shoes were brought to America by the first settlers, as part of their equipment. The Indians wore moccasins, and the white men adopted them until Thomas Beard, a shoemaker of Saint Martin's lane, London, came to Massachusetts Bay colony in

1629, bringing a supply of leather as well as a kit of tools, and became the first shoemaker on record in the colonies. As the colonies grew, other shoemakers came, and Johnson, in his 'Wonder Working Providence,' speaks of the shoe trade in 1654 as among the industries "enriching themselves very much." Many early settlers, being jacks of all trades, made their own shoes. Some raised the cattle and tanned the leather, of which their shoes were made. In New England, shoemakers tramped from settlement to settlement, making and mending shoes, and accepting board and lodging as part pay. In the larger towns, shoemakers set up regular shops. The shoemakers "inhabiting and housekeeping in Boston" were authorized to incorporate by the General Court of the Bay colony, and to enforce rules for the good of their trade. However, the Court provided that there should be no unlawful combination "for enhancing the prices of shoes or wages whereby the people suffer." The Court also provided that no butcher should make leather, that no tanner should make shoes and that no shoemaker should tan leather. It forbade the use of false and deceitful mixtures in making leather. Also it forbade the wearing of extravagant styles in footwear by persons of mean estate. Government regulation of the footwear industry during the war 1914–18 was mild compared to the government regulation during colonial times. The shoe industry flourished, as the colonies grew. But it was not strong enough to provide footwear for the soldiers of the Revolution, and Washington's troops left the bloody footprints of their bare feet in the snows of Valley Forge. John Adam Dagyr, a soldier of the Revolution, and a shoemaker, too, imported fine shoes from London and Paris, and studied them until he learned how to make shoes as good. He freely taught his skill to others. The newspapers spoke of him as "The Celebrated Shoemaker of Essex." They advised their readers to buy fine shoes made in America, instead of importing them from London and Paris.

After the Revolution, Congress put a protective tariff on shoes, and the tariff, with varying rates of duty, was kept in force until the present tariff bill, which put shoes on the free list, was adopted. The early 19th century was a golden era in the shoe industry. Shoemakers worked in little shops by their homes. The shops were called "ten footers" because they were 10 feet square. One of them is a permanent exhibit at the Essex Institute in Salem. The shoemakers read as they worked, or talked with visitors. Roger Sherman, a United States senator, who "never said foolish word," got his education by studying from books opened by his side as he made shoes. Henry Wilson, "The Natick Cobbler" who became Vice-President, got his first lessons in debate by discussing topics of the day with visitors at his little shop in Natick, Mass. Often, the minister was a Monday morning visitor at the shoe shop, and the Sunday sermon was discussed. A Bible was kept in many a shop. In large shops, the shoemakers often sang together. In small towns, men farmed in summer and made shoes in winter. Manufacturers of the cities sent cases of shoes in express wagons to the farmer shoemakers.

The kit of shoemakers of hand method days

consisted of a lap stone, a flat face hammer, awls, waxed ends, knives, rub sticks, a piece of sharkskin, used as is sandpaper to-day for buffing leather, and a bottle of blacking and other small equipment. Each shoemaker had his own kit of tools and "seat" on which he worked and kept his tools by his side. Some used their tools and seats for a lifetime. The pay was small and the employment irregular. A dollar a day was high pay. At one period, in Lynn, shoemakers were paid in orders on the union store, exchanging their orders each Saturday for flour, molasses, salt fish and other necessities. The uppers of many shoes were stitched by women who worked at home. "Binding shoes" this was called, and Lucy Larcom pictured it in her poem 'Hannah at the Window Binding Shoes.'

The change from hand to machine methods in shoemaking makes a marvelous chapter in American industrial history. Thomas Blanchard, a Yankee mechanical genius, was challenged to make a machine to turn gun stocks. He did it. The machine was adapted to making shoe lasts. So it became possible to make thousands of lasts by machinery, where only one could be made by hand. The lasts were refined, and multiplied in style, and standardized in sizes, until there is the thousand and one varieties of to-day. Elias Howe, a struggling young machinist, invented the sewing machine. John Brooks Nichols, a Lynn shoemaker, adapted it to the sewing of uppers of shoes. Women ceased to "bind shoes" at home, or sew the uppers with needle and thread in hand. The machine does the work, stitching shoes a hundred times faster than could the most skilful "binder" and doing it better, too.

Lyman Blake, a South Abington, Mass., shoemaker, invented the McKay machine for sewing soles of shoes just before the Civil War. He worked on it nights, after doing a day's work in the factory. He realized that he didn't have the business ability to put his machine on the market. So he sold it for \$70,000 to Col. Gordon McKay. When Blake asked Congress for an extension of his patents, he estimated that his machine had saved to the shoe trade \$13,979,724.30.

This McKay machine revolutionized the shoe industry. The shoemakers who worked by hand in little shops at home could not compete against the machine. Factories were established and equipped with machinery. Shoemakers came from little shops to work in the factories. Machinery was invented and developed to supplement the McKay machine for sewing soles and for stitching uppers. One by one the hand workers gave place to the machine operators. Sixty different kinds of machines are used in an average factory at present, and one factory has 137 different kinds of machines which it uses in making a single pair of shoes.

Sidney W. Winslow and others consolidated the several important shoe machinery companies into the United Shoe Machinery Company in 1899. It established a system of leasing machinery. Manufacturers pay so much royalty for each pair of shoes made on its chief machines. They buy outright the supplementary machines, which are used in preparing a shoe for the chief machine, such as a welt sewing machine, or to finish the shoe after it is sewed.

The company makes 25,000 machines a year and 21,000,000 parts. It has its machines in 98 per cent of the shoe shops of the country. It has strong branches abroad, in Europe, South America, Australia and even in Asia and Africa. The methods of the company have been the subject of much discussion in the past few years. The government prosecuted it, 12 Dec. 1911, for violation of the Sherman Anti-Trust Law. The charge was maintaining a monopoly of the shoe machinery industry. After various court actions, covering a period of seven years, the United States Supreme Court handed down a verdict that the company did not violate the Sherman law. The verdict says: "It is impossible to believe, and the court below refused to find, that the great business of the United Shoe Machinery Company has been built up by the coercion of its customers, and that its machinery has been installed in most of the large factories of the country by the exercise of power, even that of patents. The installations could have no other incentive than the excellence of the machines and the advantage of their use, the conditions imposed having adequate compensation, and not offensive to the letter and the policy of the law."

There is still pending in the courts a suit against the United Shoe Machinery Company for violation of the Clayton law, which forbids a "tying clause," or clause in leases which require that one machine shall be used in conjunction with another. This suit was brought in October 1915.

Production.—Through the development of machinery and the factory system, the production of shoes has been multiplied, wages increased, conditions of labor elevated and shoes improved. Wages have increased from \$5 or \$6 a week to \$5 or \$6 a day, and skilled workers get more. Tuberculosis, a sickness common among shoemakers who sat on their benches and stooped over their work, is no more an affliction common among shoemakers. People generally get better looking, better fitting and better wearing shoes than ever they had before.

In the shoe manufacturing industry, there are, according to the United States census for 1914, 1,355 establishments. They make 292,666,468 pairs of shoes annually. The shoes are worth \$501,760,000. They employ 191,555 persons, and paying them \$105,695,000 annually in wages. They use 100,232 horse power for driving their machinery.

New England makes about half of the shoes of the country. The business has grown rapidly in the West in the past generation. Saint Louis claims to rival Boston as the greatest shoe centre of the world. Brocton leads in men's shoes, Lynn in women's shoes and Haverhill in fine slippers. Brooklyn and Philadelphia are noted for their fine shoes. Manchester, N. H., Auburn, Me., Rochester, N. Y., Cincinnati, Ohio, Chicago, Ill., Endicott, N. Y., and Milwaukee, Wis., are among the big shoe-making centres.

The old-time shoemaker, who worked in a little shop, made a case of shoes a week, or 6 pairs. The custom shoemaker made any sort of shoes his customers desired, for men, women or children. The shops of to-day specialize, one making men's shoes only, one making women's

shoes only and one making children's only. Specialization is the secret of much of the American progress of the American shoe trade. Some shops carry it so far that they make just one grade of shoes, over just one last.

A small shop of to-day makes from 100 to 500 pairs of shoes daily. A medium-size shop makes from 1,000 to 5,000 pairs daily, a big shop makes from 5,000 to 10,000 pairs. A company with several shops makes from 10,000 to 25,000 pairs, and one great concern is credited with a production of 75,000 pairs of shoes daily. The American people average three pairs of shoes per capita per year, and spend about \$1,000,000,000 a year for their footwear. Shoes are distributed in the United States through 50,000 retail stores.

Export.—Development of export trade in boots and shoes followed close upon the development of the American shoe factory system. Exports of shoes amounted to \$419,000 in 1870. That was when machines were comparatively new, and machine-equipped shops made only a few shoes. In 1900 exports of shoes amounted to \$4,000,000. Then all shops were machine equipped, and were able to produce more shoes than the home markets consumed. Exports to Cuba increased rapidly after the Spanish-American War. Cuba is the best customer that American manufacturers have among foreign nations. Exports to South American countries began to increase after the completion of the Panama Canal. They increased enormously during the World War. For 1916 they amounted to 19,400,000 pairs, worth \$42,500,000. Many of these shoes were for the armies of France and Italy. A new rise in exports is expected after the world gets readjusted to a peace basis.

Styles.—Styles in footwear have changed much, as people changed their activities. Puritans wore plain, square-toe shoes with buckles. Cavaliers wore great boots. People walked much, until railroads came, and necessarily wore stout footwear. Men of the colonial and early Revolutionary period wore small clothes, long stockings and low shoes with buckles. Jefferson provoked bitter criticism when, as President, he first put on pantaloons and lace shoes. Women had one pair of coarse shoes for week day wear and a pair of fine kid shoes for Sunday best. Farmers wore knee high boots of heavy cowhide leather. A century ago New England manufacturers made many "stogas" or coarse brogans, for the slaves of the South. In pioneer towns it was a not uncommon practice for a thrifty farmer and his family to walk barefooted to town, carrying their shoes in their hands, and stop at the edge of the town to put on their shoes, and then walk in them to church. In grandmothers' time, serge Congress boots were common. They had uppers of cloth, with elastic gorings in the sides. Men wore Congress shoes, too. Children's shoes were crude. In shoemaking families, father's old boots were cut apart and were made over into shoes for the children. As the production of shoes multiplied, and the wealth of the people increased, a greater variety of shoes was produced, and people had at their command work shoes, dress shoes, dancing slippers, comfort shoes, fireside slippers, storm boots, fishing boots, baseball shoes, nurses' shoes and other kinds. Indeed, there is now a

special kind of shoe for almost every employment or pastime.

Toward the close of the last century, a fashion of "toothpick toes" came in, for both men and women. These shoes had toes long and slim like a toothpick. The wearing of them cramped the toes, and broke down the arches of the feet, and did other great harm. To correct these faults, ingenious persons began to make arch supporters, toe protectors, corn plasters and other remedial devices. The sale of them runs into millions annually.

As standards of shoes have advanced through improvements in manufacture, there has also been improvement in the methods of taking care of shoes. The business of making shoe blackings is extensive. The business of blacking shoes is larger to-day than was the business of making shoes a century ago. Also, machinery for repairing shoes has been developed, and the modern repair shop established in every neighborhood. Now, according to estimates, 100,000,000 pairs of shoes are repaired annually, and the repairing business totals to \$300,000,000 annually.

Rubber.—Rubber footwear is comparatively modern. Early colonists wore snow shoes, or clogs and pattens, the latter being wooden soles which were strapped to the feet, over the regular shoes. The first rubber shoes, which appeared about a century ago, were called "gum shoes." They were made of pure rubber. They froze and cracked in cold weather, and they melted and stuck together in hot weather. It was not until Goodyear discovered his process of vulcanizing rubber that rubber footwear became practicable. The making of rubber footwear flourishes in Massachusetts, Rhode Island and Connecticut. Besides making storm footwear, commonly called "rubbers," the rubber shoe companies produce millions of pairs of sport and street shoes, called "sneakers." Rubber heels are made by the millions and during the last few years, the manufacture and wear of soles of rubber and fibre has increased rapidly. See **BOOTS AND SHOES**; **LEATHER, MANUFACTURE AND USES OF**; **LEATHER AND SHOE-TRADE TECHNICAL TERMS**.

FRED A. GANNON.

SHOEMAKER, Michael Myers, American author and traveler: b. Covington, Ky., 26 June 1853. He studied at Cornell University and since 1874 has traveled extensively over the greater part of the world, making special anthropological studies. He has published 'Eastward to the Land of the Morning' (1893); 'Kingdom of the White Woman' (1894); 'Sealed Provinces of the Tsar' (1895); 'Quaint Corners of Ancient Empires' (1899); 'Palaces and Prisons of Mary, Queen of Scots' (1901); 'The Great Siberian Railway' (1903); 'Heart of the Orient' (1904); 'Winged Wheels in France' (1906); 'Wanderings in Ireland' and 'Islam Lands' (1910); 'Indian Pages and Pictures' (1912), etc.

SHOGUN, shō-goō, the highest officer in the Japanese government during the continuance of the feudal system. He was originally a purely military official, commander-in-chief of the army and first vassal to the emperor. The office became hereditary, and the Shoguns gradually acquired nearly all the real powers of government, leaving only the

title of royalty to the emperor. The latter resided at Kyoto while the Shogun held court at Yedo (Tokio) whence he ruled in the emperor's name as his major-domo. The shogunate was abolished in 1868. See JAPAN, HISTORY.

SHOLOM ALEICHEM. See RABINOWITZ, SOLOMON.

SHONTS, Theodore Perry, American railroad official: b. Crawford County, Pa., 5 May 1856; d. New York, 21 Sept. 1919. He was graduated at Monmouth College in 1876 and for a time practised law, but soon became interested in railroad construction. He was in charge of the construction of part of the Iowa Central Railroad and afterward built and was controlling owner of the Missouri, Iowa and Nebraska Railroad. He also gained control of the Toledo, Saint Louis and Western Railroad. In 1905-07 he was chairman of the Isthmian Canal Commission, to which post he was appointed by President Roosevelt. He was president of the Interborough Metropolitan Railroad of New York 1907-19, and president and director in many important railroad and trust companies.

SHOOTER ISLAND, an island in Newark Bay, separated by a narrow channel from Staten Island, N. Y., one mile east of Elizabeth, N. J. It is chiefly noted for its large shipbuilding plant.

SHOOTING STARS, are small bodies that enter the earth's atmosphere from without and, being intensely heated by impact with the air, are consumed before reaching the ground. They probably vary greatly in size, but it is believed that the vast majority do not exceed a few grains in weight. A few may be seen on any clear night, and the number entering the atmosphere every 24 hours has been estimated by Professor Newton at not less than 15,000,000. Most of them are no brighter than ordinary stars, but some rival the brightest planets in luminosity. They seem to leave shining trails behind them, which are perhaps sometimes due to persistence of vision. But the larger ones, resembling brilliant fireballs, leave trails which sometimes remain visible for many minutes. Besides the true shooting stars there are certain massive, meteoric bodies which sometimes reach the earth's surface; these are called meteorites and will be found described under a separate heading. (See METEORITES).

Shooting stars before encountering the earth are invisible to us, traveling in their own orbits about the sun. The moment they strike the atmosphere their kinetic energy begins to be transformed into heat, and they become visible at an elevation of from 75 to 100 miles, where the air is more rarefied than under the exhausted receiver of an air-pump. This rarefaction of the upper air does not, however, save them from the effects of their impact with the atmospheric molecules. Sir William Thomson (Lord Kelvin) has shown that the effect of the friction of the air upon a particle is the same as if the latter was enveloped in a blowpipe flame having a temperature of many thousands of degrees, and the degree of temperature thus developed does not depend upon the density of the medium, but is as great in rare as in dense air. Under these circumstances small particles may be consumed in a fraction of a second. Even if shooting stars, instead of mov-

ing independently about the sun, stood fast in space to be encountered by the earth in its annual flight round the sun, their fate would be similar, for the velocity of the earth in its orbit is nearly 19 miles per second, and Professor Newcomb has pointed out that the rise of temperature produced by the impact of our atmosphere with a meteoroid at rest would be nearly 600,000 degrees! But before such a degree of temperature is actually attained the shooting star, even though composed of the most solid metal, must be burned up or volatilized with an immense evolution of light and heat. This accounts for the visibility, at the height of 50 to 100 miles, of particles whose mass may not exceed a single grain.

The height of a bright shooting star may be ascertained by comparing observations of its apparent track among the stars made simultaneously from two points on the earth's surface, a number of miles apart. Each observer sees it projected in a different direction, and the fixity of the star-marked background of the sky across which it moves affords the means of determining the angle between the lines of sight of the two observers. This gives the parallax, and, the length of the base line between the observers being known, its distance and elevation can thence be calculated. It is probable that all shooting stars are entirely consumed by the time they have descended to within 40 or 50 miles of the earth's surface; it cannot be doubted, however, that after floating in the air for perhaps a very long time in the form of impalpable dust, their material finally settles down and comes to rest upon the earth. But the quantity of this is so minute that it would be hopeless to search for it upon the soil and lands of the earth. Nordenskiöld, by melting many tons of polar snows and filtering the water, found a residuum of minute globules of oxide and sulphide of iron, and similar particles have been found by dredging at great depths in the sea. Altogether it is certain that the mass of our earth is being continually increased in this way, but its growth is excessively slow. If we assume that 20,000,000 shooting stars fall daily (probably a reasonable estimate), and that the average weight is one-fourth of an ounce, a simple computation shows that there will be thus added to our earth no less than 50,000 tons in each year. At this rate some 800,000,000 years will be required for the deposition of a layer one inch in thickness over the entire earth's surface. It is an important astronomical consideration that this must diminish the rate of rotation of the earth and thus produce a secular lengthening of the day. The action of the tides also tends to lengthen our fundamental unit of time, while the slow shrinking of the earth shortens it; whether the combined effect of all causes is an actual quickening or a slackening of the earth's rotation we do not know. No method of investigation yet devised has been sufficiently refined to detect any change during historic time.

In addition to the sporadic shooting stars which may be seen on any dark night, darting in various directions across the heavens, these bodies occasionally appear in showers, when the sky seems to be filled with flying sparks of fire all radiating from some fixed point among the constellations. These showers are caused by

the earth encountering streams of particles traveling in elliptical orbits about the sun.

Scientific study of the orbits of shooting stars began after the occurrence of the most brilliant meteoric shower on record, that of 13 Nov. 1833. This spectacle, which excited the greatest interest among all beholders and was looked upon with consternation by the ignorant, many of whom thought that the end of the world had come, was witnessed generally throughout North America, which happened to be the part of the earth then facing the meteoric storm. Hundreds of thousands of shooting stars fell in the course of two or three hours. Some observers compared their number to the flakes of a snowstorm, or to the raindrops in a shower. The more observant spectators noticed that all the meteors appeared to radiate from a fixed point in the constellation Leo. Tracing their trails backward it was seen that they came together at that point, like the ribs of an opened umbrella meeting about its central stick. This peculiarity is now known to characterize all showers, although when the number of shooting stars is not very great the ribbed appearance produced by the convergence of their trails around the starting point is not so conspicuous. The common centre from which they appear to radiate is called the radiant point, and the determination of its exact location among the stars is of the first importance in ascertaining the actual path of the particles in space outside the earth. A considerable number of such radiant points are now known, each different swarm whose orbit happens to intersect the orbit of the earth having its own radiant, the position of which depends upon the situation of its orbit with reference to the earth.

The explanation of the radiant point depends simply on the laws of perspective. The particles are traveling in parallel paths in a broad cylindrical column, which may envelop the whole earth. When they become visible by striking the air, the observer, looking in the direction from which they approach, sees those that are coming straight toward him as bright points, which grow rapidly larger and then suddenly disappear when they are consumed. Others which, if they reached the earth, would strike to the right or left, or in front of or behind him, appear to diverge in all directions. The same effect is visible when snowflakes are falling vertically on a calm day. Looking straight upward in the midst of the shower of flakes the observer sees them apparently diverging toward every point of the compass, with the exception of the few that fall straight into his eyes.

Immediately after the great display of 1833 Prof. Denison Olmsted of Yale College announced that what had occurred was an encounter by the earth with a vast swarm of particles moving around the sun. The probability that such an encounter was a recurrent phenomenon suggested itself. It was also observed that there were other, less brilliant, showers at different times of the year, notably the annual display on 10 August, having its radiant point in the constellation Perseus. George Adolf Erman, a German physicist and mathematician, about 1839, clearly showed how the orbits of the swarms causing such showers could be determined, but it was not until Prof. Hubert

A. Newton of Yale College took up the inquiry in 1864 that the final solution of the problem was begun. Professor Newton, by a careful discussion of ancient records, demonstrated that ever since the 10th century of our era there had been recurrent showers in the autumn at an average interval of $33\frac{1}{4}$ years. Sometimes the interval was 34 years and sometimes only 32 years, or less, but the mean was $33\frac{1}{4}$. Upon this basis a return of the shower was predicted for 1866 or 1867.

There had been a gradual change in the date of the showers, which, beginning with 13 October in the year 902, had become 13 November in 1833, but this could be accounted for by planetary attractions shifting the position of the orbit so that its point of intersection with the orbit of the earth moved forward along the latter about a degree and a half in a century.

It had also been observed that usually there was a considerable display a year before or a year after the principal shower. The evident explanation of this was that, instead of being concentrated at one point on their orbit, the particles were strung along in a column of sufficient length to occupy at least two years in crossing the point of intersection with the path of the earth, so that the latter after meeting them once could complete its annual circuit and arrive again at the crossing place before the whole column had passed.

The question remained, what was the length of the orbit of the shooting-star particles or how long a time did they require to make a single journey round the sun and return to their meeting place with the earth? Professor Newton's computations showed that there were five different orbits, any one of which would be consistent with the observed facts. The test by which the real orbit could be selected from the five possible orbits depended on the perturbing action of the planets, already referred to, and the application of this test would require long and laborious mathematical work.

Before this work had been done a predicted return of the phenomenon occurred, with a notable shower in November 1866, followed by a second display the next year. On neither occasion was the spectacle equal to that of 1833. Prof. John Couch Adams of Cambridge University, England, now took up the work of computing the planetary perturbations, and he showed that the period of $33\frac{1}{4}$ years must be the true one because it alone satisfied all the conditions of the problem. This period, it will be seen, corresponds exactly with the mean interval between the showers. The orbit is a long ellipse, its inner end being a little nearer the sun than the earth is, its outer end beyond the orbit of Uranus.

The period and orbit of the November shooting stars having thus been determined, their next return, in 1899 or 1900, was eagerly awaited. Before the time arrived, however, astronomers had begun to foresee the probability of a disappointment. Dr. G. Johnstone Stoney and Mr. A. M. Downing had calculated the perturbative effect of Jupiter and Saturn upon the swarm, the action of these planets having been particularly effective after 1867, and had pointed out that the result must have been a swerving inward of the orbit of the swarm, so that it could no longer intersect

the earth's orbit at the old meeting point. The event justified these calculations, for, although a considerable number of shooting stars were seen in 1899 and 1900, there was no such display as would have occurred had the earth plunged through the main stream.

The orbit of the August shooting stars or Perseids was also calculated, and this was found to be a still larger ellipse, extending at its most distant point far beyond the orbit of Neptune. In this case the showers occur annually, every time the earth crosses the orbit. This is due, as Erman showed, to the particles having become spread entirely around their orbit in a closed ring, so that they are continually passing the point of intersection with the orbit of the earth. A few of the November shooting stars are seen nearly every year, showing that some of them also have been scattered along the entire circuit of the orbit, although the greater number, in this case, are still collected in a swarm, confined to a relatively small part, one-tenth or one-fifteenth, of the entire length of the orbit.

The next step was the discovery of an intimate relationship between shooting stars and comets. In 1867 Giovanni Schiaparelli of Milan showed that the August swarm travels in the

nature. A comet known as Biela's, which had split in two in 1846, failed to return when due in 1872, but on the night of 27 November of that year, when the earth was passing close to the orbit of the missing comet, a new and brilliant shower, with its radiant point in Andromeda, made its appearance. This was seen again in 1885 and 1892. The orbit coincides with that of the lost comet of Biela. The interval between the displays is seven years, but owing to planetary perturbation the date of appearance in 1892 had fallen back from 27 November to 23 November. They were not seen in 1899.

About a hundred shooting-star swarms have now been recognized, most of them furnishing very inconspicuous displays, and at least half a dozen of these have been shown to travel in the paths of comets. In the table below are given the elements of the orbits of the three greatest swarms known to be connected with comets, compared with the elements of the orbits of the comets concerned.

Following is a list of the principal showers with the positions of their radiant points and the dates of their maximum displays. The names are derived from the constellations in which the radiants are situated:

PRINCIPAL SHOOTING-STAR SHOWERS.

NAME	Radiant		Maximum	Mean and train
	Right ascension	Declination		
Quadrantids.....	15 H., 19 M.	N. 53°	Jan. 2	Swift; long paths.
Lynxids.....	17 59	N. 33°	April 20	Swift.
Eta Aquarids.....	22 30	E. 2°	May 7	Swift; streaks.
Delta Aquarids.....	22 38	S. 11°	July 28	Slow; long.
Perseids.....	3 4	N. 57°	Aug. 10	Swift; streaks.
Orionids.....	6 8	N. 15°	Oct. 19	Swift; streaks.
Leonids.....	10 0	N. 23°	Nov. 15	Swift; streaks.
Andromids.....	1 41	N. 43°	Nov. 19	Very slow; trains.
Geminids.....	7 12	N. 33°	Dec. 12	Swift; short.

same path as that of a bright comet known as Tuttle's, which was discovered in 1862. Shortly after this announcement, and while it was still under discussion, Leverrier published a revised orbit of the November, or Leonid, swarm and almost simultaneously Oppolzer published an orbit of Tempel's comet, which had appeared in 1866. Examination showed that these two orbits were practically identical, thus seconding Schiaparelli's conclusion with regard to the August shooting stars by furnishing proof that the November swarms also traveled in a comet's track. In 1872 there came a third discovery of the same

These showers occur annually and some of them continue for several nights in succession, the position of the radiant slowly shifting in the meantime with the change in the direction of the earth's motion in its orbit. The Perseids last for no less than five weeks.

Some have supposed that all known swarms are composed of the scattered debris of comets which have been broken up by the tide-producing action of the sun, but this is not yet certain. The amount of disintegration suffered by a comet depends upon the number of its trips round the sun, so that the longer it

has revolved in an orbit having a short perihelion distance the more widely its particles may be scattered along its track. Since the Leonids still form a somewhat compact swarm, while the Perseids are scattered in a complete ring, it has been assumed that the former are later comers in the solar system (or at least later comers into the near neighborhood of the sun) than the Perseids. Leverrier tried to fix the date of their first appearance by showing that Tempel's comet, with which the Leonids are related, must have suffered perturbations from a near approach to the planet Uranus in the year 126 A.D., which may have changed its orbit from a very large ellipse, having a perihelion point almost as distant as the orbit of Jupiter, to a smaller ellipse corresponding with the present path pursued by the comet and the particles of the November swarm.

ERIC DOOLITTLE,

Director Flower Astronomical Observatory,
University of Pennsylvania.

SHORE, Jane, mistress of Edward IV: b. London; d. there, 1527. She was remarkable for her beauty and cultivated mind. Her influence with Edward was never exercised but for the benefit of others. (See EDWARD IV). Richard III, partly to revive among the citizens the memory of the licentiousness of his brother, whom he accused of being "the chief abettor of that witch Shore," determined to expose her to public ignominy by accusing her of witchcraft. He was unable to effect his purpose but directed her to be tried for adultery by the Spiritual Court, which condemned her to do public penance in a white shift at Saint Paul's. She was reduced to poverty, and appears to have died in 1526 or 1527. Her story appears in literature in Shakespeare's 'Richard III'; in a tragedy 'Jane Shore,' by Rowe, in many old English ballads, and it has been introduced upon the French stage.

SHORE-BIRDS, the sportsman's name for that large group of limicoline birds, as plover, sandpipers, curlew, phalarope, oyster-catcher, etc. (q.v.), which are to be found along the beaches of the sea or other large bodies of water, where they seek their food at the edge of the waves. Shore-bird shooting is an amusement of the autumn and early spring, when these birds are migrating between the South and the far northern breeding-places to which most of them resort in summer, and is usually carried on by the aid of stationary decoys, and calls for skill and patience. Consult Coues, E., 'Birds of the Northwest' (Washington 1874); Elliott, D. G., 'North American Shore Birds' (New York 1898); Job, H. K., 'Among the Water Fowl' (New York 1902); Seebohm, 'Geographical Distribution of the Family Charadriidae' (London 1887).

SHORE-LARK, a small bird (*Otocoris alpestris*), a native of the north of America, Europe and Asia. Within the United States it is found in winter as far south as North Carolina and Illinois. The adult male is about seven inches long; in summer, lores, cheeks, gorget and band on top of head, ending in erectile tufts, black; nape, mantle and upper tail coverts pinkish-brown, white beneath. The eastern or typical shore-lark breeds along the northern

border of the United States and in British America. In winter it migrates southward in flocks, which frequent open fields and the seaside meadows. In the western and interior parts of the United States numerous distinct varieties occur, some of which breed in the mountains within our borders. They range as far south as Texas and Mexico. The shore-larks are closely related to the famous skylark of Europe. They nest in a depression in the ground and lay four or five eggs—French white, mottled with dull olive-green or yellowish-brown, but very variable. Nesting begins very early in the spring and several broods may be raised.

SHORE LINE, the dividing line between land and water in rivers, lakes or oceans. Shore lines are continually being modified by wave work, especially on the larger bodies of water. Waves strike blows averaging several hundred pounds per square foot and, armed with sand and gravel, are powerful agents of erosion. They undermine cliffs and carve out sea caves. In many places, especially along the chalk cliffs of England and France, where the rocks are soft, coasts are worn back at an average rate of several feet a year. The island of Heligoland, which in the year 800 A.D. had a circumference of 120 miles, to-day has a circumference of only three miles, and would probably be worn completely away, were it not for artificial protection.

The material thus worn away builds beaches. Where the debris is coarse, boulder or shingle beaches result; where finer, sand beaches are formed. Much sand is drifted parallel to the coast line by shore or littoral currents (q.v.), and where it drifts past some bend in the coast, the beach is prolonged into a spit extending past the bend out into deep water. Due to the constant action of waves and tides the ends of spits are often curved into hooks, as at Sandy Hook. If a spit or hook grows out so that it connects an island to the mainland, a tied-island results. On low, flat, gently sloping coasts, the waves break some distance from shore. At this point sand is heaped up by the action of waves and undertow, and an offshore or barrier beach is formed. Between it and the mainland is a lagoon or salt marsh, which gradually fills with decaying vegetation and wash from the land, and here peat (q.v.) beds are often formed. Off the mouths of large rivers, deltas (q.v.) are built extensive mud flats or tidal flats occur.

Shore lines are profoundly modified by changes of level. Because the ocean bottom is smooth, the uplift forms long straight coasts, known as coasts of emergence. Along such coasts abandoned beaches and wave-cut cliffs may be seen well above water-level, testifying to recent uplift. Such beaches are numerous on the coast of California. When lakes are drained or dry up, such abandoned beaches are also common, as around the old shore line of Great Salt Lake (q.v.). On the other hand, when a coast sinks, or is drowned or submerged as it is usually called, the sea enters the river valleys, forming long, narrow and often branching bays, like Chesapeake Bay. The tops of former hills may become offshore islands, as has happened at many points along the coast of Maine. Drowned shores afford the best har-

bors. The famous Inside Passage to Alaska is the result of deep drowning of a very mountainous coast. See OCEAN; LAKE; and the sections on OCEANS, LAKES and DIASTROPHISM in the article on GEOLOGY.

SHOREDITCH, England, a metropolitan and Parliamentary borough of London, directly north of the city. Area, 658 acres. The district is an extremely poor and crowded one, in which cabinet-making and chain-making are among the principal industries. The borough returns two members to the House of Commons. Pop. about 111,390. Consult Ellis, 'History and Antiquities of the Parish of St. Leonard Shoreditch and Liberty of Norton Folgate' (1798).

SHOREY, shō'ri, Paul, American educator: b. Davenport, Iowa, 3 Aug. 1857. He was graduated from Harvard University in 1878, and was admitted to the Chicago bar in 1880. He was professor of Greek at Bryn Mawr College 1885-92, resigning in the latter year to fill a similar chair at the University of Chicago. He was professor in the American School of Classical Studies at Athens 1901-02, and was appointed by Columbia University Roosevelt professor in the University of Berlin 1913-14. He was managing editor of, and a contributor to, *Classical Philology* from 1908. He published 'De Platonis Idearum Doctrina' (1884); 'The Idea of Good in Plato's Republic' (1895); 'The Odes and Epodes of Horace' (1898; revised ed. with Laing, 1910).

SHORT BALLOT. See BALLOT.

SHORT-CIRCUIT. See ELECTRICAL TERMS.

SHORT-EARED OWL, a small, nearly cosmopolitan owl (*Asio accipitrinus*), so called because its ear-tufts are inconspicuous as compared with those of its relative, the long-eared owl (*A. wilsonianus*). It is buffy, whitish, striped with dark brown, and 15 inches in total length. Its habits are those of ordinary owls (q.v.).

SHORT LOAN AND COMMERCIAL BILLS. See BANKS AND BANKING — INTERNATIONAL BANKING.

SHORTER, Clement King, English editor: b. London, 19 July 1857. He was in the Civil Service from 1877 to 1890, when he began editorial work and became editor of the *Illustrated London News* from 1891 to 1900; founded *The Sketch* (1893) for the same company and edited it for seven years; also during the same period editing the *English Illustrated Magazine*. After 1900 he became editor of *The Sphere*. Outside his editorial work his Brontë studies are notable contributions to English literature and include 'Charlotte Brontë and her Circle' (1896); 'Charlotte Brontë and her Sisters' (1905); 'The Brontës: Life and Letters' (2 vols., 1907); among his other works are 'Sixty Years of Victorian Literature' (1897); 'Immortal Memories' (1907); 'Napoleon in his own Defence' (1910); 'George Borrow and his Circle' (1913), etc.

SHORTER CATECHISM, a catechism extensively used by English-speaking Presbyterians throughout the world, and which was framed during the time of the English Commonwealth. A committee of assembly was ap-

pointed 5 Aug. 1847 to prepare the Shorter Catechism, which was presented to the English Parliament 26 November, that year, and was ordered to be printed by vote of Parliament, 16 April 1648. The Scotch general assembly adopted the catechism 16 July 1648, and the Scotch Parliament the following February ratified this action. See CATHECHISM.

SHORTHAND has often been defined as the art of writing as fast as a man speaks. The Standard Dictionary definition is better: Shorthand—any system of handwriting that reduces the number of muscular movements required to present words and sentences in graphic outline . . . opposed to longhand. The former definition applies with accuracy only to the most highly developed phase of shorthand—verbatim reporting—applies with much less force to the enormously larger field of business office stenography and ignores the largest and most important potential field of shorthand—shorthand for general personal (non-professional) use.

Four Principal Characteristics.—The shortness of shorthand as compared with longhand is due to four principal factors:

1. Shorthand writes by sound, ignoring the eccentricities of common spelling. This feature alone would, even though each letter of shorthand averaged as long as the letters of longhand, save 15 per cent of time and effort directly, by eliminating superfluous letters, and still more indirectly, by eliminating the mental hesitation involved in following the inconsistencies of common spelling.

2. Shorthand uses for its basic alphabet the simplest signs which its inventor can devise or adapt—seldom averaging more than 1.1 strokes per letter, as compared with about four strokes per letter for longhand as usually analyzed. This feature alone does not, as might first appear, save as much as 75 per cent of the labor of writing, for the letters of longhand are so devised as to join with each other in any order with no appreciable modification of form, direction or position relative to the line of writing—a condition conducive to the highest speed of automatic action and impossible to duplicate fully in any shorthand.

3. Shorthand, by various devices such as the position of strokes relative to the line of writing or to each other, or modifications of length or shading, or initial or final circles, hooks or loops, known as appendages, gives to a single stroke a multiple significance, so that in Pitmanic shorthand, for example, the sign *h* expresses or implies by logically related rules every one of the six consonants of the word *sprints* in their proper order.

4. Shorthand abbreviates words or phrases much as in longhand, expressing or implying only so many of the sounds as will serve to identify the words written. This is carried to a high degree requiring careful memorization in certain forms for common words, known as word-signs, and is sometimes carried still further by arbitrary or exceptional use of dots or ticks for particular words, such outlines being known as arbitraries.

Number of Systems.—In the absence of fixed standards of measurement or clear determination of fundamental principles (see SHORTHAND, SCIENCE OF) more than a thousand dif-

ferent systems of shorthand have been published for English alone—a confusion unparalleled since Babel. Fortunately at least nine-tenths of these are of historic interest only to-day, while the remainder may be grouped in a comparatively few more or less well-defined classes.

Three Distinct Styles.—No intelligent answer can be given to the first question of the layman: "Which is the best system of shorthand?" without recognizing that there are three distinct broadly marked fields of shorthand use which may be designated as reporting, business and personal—related, to be sure, but each with its own peculiar problems.

A reporting style of shorthand must use all practicable shorthand devices to their fullest extent with effective (legible) speed, the paramount consideration, attaining a speed from 150 words per minute up to the highest yet achieved, between 280 and 300 words per minute. Such a style will be used for court reporting, legislative reporting, speeches, conventions and in general all verbatim reporting purposes, where the speaker ignores the reporter. Mastery of a reporting style requires long and arduous professional training extending over a period of several years, and commands rewards proportionate to the effort required. The most competent estimates place the total number of verbatim reporters in the United States under 5,000.

A business style of shorthand must use abbreviating devices to some extent but must maintain positive legibility and reasonable simplicity even at the expense of speed, attaining speeds from 90 to 150 words per minute. Such a style will be used chiefly for business office dictation of correspondence, numerically much the largest field of shorthand to-day. Reasonable mastery of a business style is afforded by the average six months' business school course involving about 300 hours' study. Though the 1910 census shows only about 330,000 professional users of shorthand or typewriting, there are undoubtedly to-day (1919) at least 500,000 stenographers or business style shorthand writers in the United States.

A personal style of shorthand must make phonetic correctness and completeness and simplicity the paramount considerations, attaining speeds from 60 to 100 words per minute. Such a style will be used for personal correspondence by professional writers or speakers for original composition, for lecture notes, abstracts, memoranda and potentially for all purposes of longhand. No system not particularly designed for such personal style use can be mastered to the point of even 60 words per minute speed in less than 100 hours by the average student. Considering the enormous potential value of shorthand for general personal use—the goal and vision of shorthand inventors for centuries—the number of personal style, non-professional, shorthand writers is pitifully small—a condition for which the futile effort to make business style and reporting style shorthand systems serve this distinctive field is chiefly responsible. Each of these three styles has its own problems and its own field, and in each field at the present time a fundamentally different type of system is most prominent.

Reporting.—In the reporting field to-day Pitmanic shorthand is dominant, despite the most strenuous efforts of competing systems of other types. A recent census of the National Shorthand Reporters' Association indicates that 91 per cent of its membership write some form of Pitmanic shorthand.

Business.—In the business field an entirely different type of system, often miscalled "script" shorthand, of which the principal American representative is Gregg shorthand, has recently achieved a marked predominance. A recent questionnaire sent out by the National Educational Association to over 11,000 schools, and eliciting over 3,000 replies, indicates that 67 per cent of all schools, public or private, teaching shorthand (which in at least 99 per cent of all cases means business style shorthand) are teaching Gregg shorthand.

Personal.—In the personal style field no accurate statistics are possible, largely owing to the lack of true personal style systems. The nearest approach to a distinctive and rational personal style system in the past was Lindsley's Takigrafy, which attained considerable prominence during the last one-third of the 19th century, but has to-day largely disappeared. The only system alive to-day particularly designed to meet the exacting but little understood requirements of general personal use, in accord with the science of shorthand, is Personal Shorthand (Dewey), which is still too new to justify further comment at this time.

Pitmanic Shorthand Characteristics.—All Pitmanic shorthand is based on the original invention and subsequent modifications of Sir Isaac Pitman (1813-97), justly styled the father of modern shorthand. The distinctive characteristics of all Pitmanic systems include (see also comparative alphabets and specimens following):

(1) Detached vowel-group signs which are distinguished by the position in which they are written relative to the consonant stems. (2) A primary consonant alphabet of 24 stems, of which 21 are alike in all Pitmanic systems, composed of straight lines and circular curves, written on four different slopes and of two thicknesses (shading), but of one uniform length. (3) A secondary consonant alphabet of appendages, circles, hooks and loops, used under various conditions for alternative expression of the more common consonants, supplemented by further devices such as writing consonant stems one-half or double their normal length to imply other additional consonants, or writing outlines above, on or below the normal line of writing to indicate that an omitted vowel is one of a particular group.

Pitmanic Variations.—Of the many variant forms of Pitmanic shorthand which have been published, the Benn Pitman, Graham, Isaac Pitman and Munson are the most important in the United States, ranking in that order of numerical strength. In Great Britain, under more stringent copyright protection, the parent Isaac Pitman system is dominant, but in this country it is altogether secondary to the dominant Benn Pitman and closely related Graham.

The principal differences between the leading Pitmanic systems are: (1) Three conso-

nants, w y h, which are written: Benn Pitman, Graham , Isaac Pitman , Munson . (2) The relative positions of two pair of the dot vowels which are written

Benn Pitman, 
Graham, 
Isaac Pitman, 
Munson, 

(3) Various minor details, especially with regard to the writing of small and large hooks on consonant stems.

Gregg Shorthand Characteristics.—The distinctive characteristics of Gregg shorthand include: (1) Joined vowel-group signs which are distinguished by detached diacritic marks; (2) A consonant alphabet composed of straight lines and elliptic curves, written on only two slopes and of only one thickness (non-shading); but of three lengths. (3) Conspicuous absence of those compound consonant devices which add complication on the one hand and power on the other in Pitmanic shorthand.

Personal Shorthand Characteristics.—The distinctive characteristics of personal shorthand include: (1) Joined vowel signs explicit without further distinction; (2) a consonant alphabet of straight lines and curves, written on four slopes, of two thicknesses (shading), and of one length; (3) compound consonant signs designed and used primarily for the true consonant compounds of English, especially those which occur before the vowel of their syllable.

Comparative Alphabets.—The table following gives the basic alphabets of the three systems reviewed as most representative of the three styles of shorthand to be distinguished. The sounds of the shorthand signs are keyed by the N E A alphabet (see PHONETICS), used as Key 1 of the New Standard Dictionary and its abridgments, the only phonetic key suitable for general popular use in English. (1) Benn Pitman Phonography; (2) Gregg Shorthand; (3) Personal Shorthand.

Comparative Specimens.—The specimens following give a familiar selection, the Lord's Prayer (Matt. vi, 9-13), in the reporting style of Benn Pitman Phonography, the business style of Gregg Shorthand, and the personal style of Personal Shorthand.

Benn Pitman Phonography reporting style

Personal Shorthand personal style

Gregg Shorthand business style

The best system of shorthand or the best style of a particular system is that style or system which best meets the requirements of the writer. The shortness and complexity of

a true reporting style is altogether unsuitable for general personal use. The simplicity and fulness of a true personal style is altogether impossible for reporting practice. The unsuitability of a business style for reporting or personal use differs nowise in kind but only in degree.

GODFREY DEWEY,
Honorary Member of the National Shorthand
Reporters Association.

SHORTHAND, History of. The early history of this art is closely allied with palæography, and it has been traced into the mists of antiquity. Antiquarians have tried to connect it with hieroglyphics and to show that it was used more than 1,000 years before Christ by the Persians, Egyptians and Hebrews. Abbreviated writing, to take down lectures and also for the preservation of poems recited at the Pythean, Nemean and Olympic games, was practised by the early Greeks, and there are specimens of ancient Greek *notæ*, or shorthand, in the Vatican Library, at Rome, the Bibliothèque Nationale, at Paris, and the British Museum.

Ancient History.—The definite existence of shorthand reporting dates in the century preceding the Christian era. Tiro, the accomplished freedman and amanuensis of Cicero, was in 63 B.C. the first known practitioner of the art. He reported speeches of his master, which were afterward revised by the orator; and as *notæ Tironianæ* became the established name for shorthand writing its invention was subsequently ascribed to him. At that period Rome was drawing from Greece her stores of learning and art, and Tiro's system was probably an adaptation from the Greek. Plutarch informs us in his life of Cato the Younger that Cicero distributed *notarii* (shorthand reporters) in various parts of the Senate House on the occasion of the vote as to the fate of Catiline, the chief purpose being to take down the speeches of Cæsar and Cato. The text of those speeches may be given by Sallust in his history of the Catilinian conspiracy, chapters 51–53, or the historian may have followed the example of Thucydides and embodied in them his conception of the character and policy of the two foremost senators. Mæcenæ, the famous statesman, courtier and patron of literature, introduced some improvements in shorthand, and, according to Dion Cassius, instructed many in the art through his freedman Aquila. Seneca afterward increased the number of notations to a total of 5,000. Scalinger made a collection of the notes of Tiro, Seneca and others, which is appended to the great work of Janus Gruterus, published at Heidelberg, in 1603.

An illustrious German scholar, Ulrich, in 1817 analyzed the Tironian notes and his analysis shows that Roman shorthand, though a strain on the memory, answered the practical purposes of stenography quite as well as the systems in vogue in the early part of the 19th century, such, for example, as the one sketched by Charles Dickens from his own experience in the 38th chapter of 'David Copperfield.' We are informed by Suetonius that the Emperor Augustus taught the art to his grandchildren and that the Emperor Titus was a skilful stenographer. Martial, who lived in the time of Nero, has left an epigram upon a shorthand

writer: *Current verba licet, manus est velocior illis*. Among ancient papyri discovered 100 miles south of Cairo in 1903 by Professors Grenfell and Hunt, there is a contract with a writer of tachygraphy, made 137 A.B., whereby a slave boy was to be taught shorthand for 120 drachmæ (\$24); 40 drachmæ were to be paid down, 40 more on satisfactory evidence of the progress of the boy and the last 40 when he had become proficient.

Shorthand seems to have been much used by the early Christians. It is supposed that Saint Paul dictated to amanuenses several of his epistles, notably that to the Colossians, where Tychicus acted as shorthand writer and Onesimus as transcriber. We know that Origen in the 3d century was assisted in the preparation of his 'Commentaries on the Scriptures' by clerks who wrote in shorthand from his dictation. Saint Augustine refers to an episcopal assemblage held at Carthage late in the 4th century, at which eight stenographers were employed in relays of two. About the same period the poet Ausonius praised a youth who could write faster than his master could dictate, and, with poetic license, even faster than he could think; and in another poem expressed his admiration of the skill of the stenographers of the time. Charlemagne, king of the Franks for 46 years and likewise Roman emperor during the 14 years preceding his death in 814, possessing an amount of learning unusual in his age, endeavored to become proficient in writing Tironian notes. But the *lingua Latina* was fast giving place to the *lingua Romana*, from which the modern Romanic languages of Europe sprang. At the Council of Rheims in 813, priests were admonished to address the people in the rustic tongue. Nor was a knowledge of the art confined to the Western civilization. A translation by Professor Flügel, of Dresden, from the Arabic, narrates how a Chinese in 923 A.D., who had acquired Arabic speech and writing in less than five months, took down in shorthand from the lips of his teachers 16 books of Galen.

Modern History.—The first modern shorthand work was printed in London in 1588 and dedicated by its author, Dr. Timothy Bright, to Queen Elizabeth. The first French publication, that of Jacques Cossard, appeared in 1651. The oldest German system was published in 1679. Gurney's is the oldest living system of English shorthand. It was first issued by Mason in 1672 and improved by Thomas Gurney in 1750. Taylor's system appeared in 1786, subsequent editions of which bore the name of Odell, Harding and so on. This system has a remarkable history of successful adaptation to Continental languages. Bertin adapted it to the French and Danzar in 1801 adapted it to the German language. Marti's tachygraphy was an adaptation of Taylor's alphabet to the Spanish language and was first published in 1800. By a royal ordinance in 1802 a chair for shorthand was established in the university at Madrid and Marti named as professor. The cortes of Cadiz first had an official shorthand report of its proceedings in 1810. Marti's tachygraphy was in 1828 applied to the Italian language by his son, who also adapted it to the Portuguese. Pereira had also, early in the century, adapted Taylor's alphabet to the Portuguese. The intro-

duction of shorthand into Mexico and the countries of South America followed these adaptations. Amanti, an Italian, adapted Taylor's shorthand to his own language and as modified by Delpino it is now used by the official corps of the Chamber of Deputies. The three prevailing French systems are those of Prevost, Duploye and Prépéan, the first named being a modification of Taylor. It is estimated that the bibliography of shorthand comprises 16,000 volumes, exclusive of reissues or editions. A valuable contribution to the English branch of this subject has been made by Julius Ensign Rockwell, published by the government as Circular of Information No. 2, Bureau of Education, Washington (1884), and Circular No. 1 (1893). The latter contains a reproduction of 112 English shorthand alphabets, extending from the first alphabetic system, that of Willis, in 1602, to the Duployan method adapted by Pernin in 1882. In 1888 'Light Line Phonography,' issued later as 'Gregg Shorthand,' was introduced.

A court of law in England in 1740 took the initial step in appointing an official shorthand writer. The next instance of the public recognition of shorthand in that country occurred in 1789, when the House of Commons, during the trial of Warren Hastings, called the shorthand writer to the bar and required him to read from his notes the exact words used by Mr. Burke, and thereupon resolved that Mr. Burke had exceeded his instructions in accusing Sir Elijah Impey of murder. The publication of Hansard's Debates was begun in 1803 and has become a general system of reports of representative bodies in Great Britain and her colonies. It is compiled from newspaper reports, supplemented by special reports. This system is closely followed in some of the colonies, as in New Zealand, while a method similar to that pursued by our national legislature has been adopted by the Canadian Parliament. The Hansard's report is semi-official, the speeches being submitted to members for revision and it is subsidized by the House of Commons. The official shorthand writing for the British Parliament is confined to the committee reporting, in which Pitman's and Gurney's systems have long had governmental recognition.

A census taken in 1914 of the systems of shorthand used in the Press Gallery of the British Parliament showed that out of 137 writers 128 wrote the Pitman system, 4 the Taylor system, 2 the Gurney system and 3 the Sloan-Duployan system.

The American colonies were not far behind the mother country in the use of shorthand. The Virginia Convention of 1788, called to deliberate on the ratification of the Constitution of the United States, was reported in shorthand in a meritorious manner by David Robertson, of Petersburg, Va., and in 1903 the National Shorthand Reporters' Association of the United States erected a tablet in Saint Augustine's Church, Philadelphia, to the memory of Thomas Lloyd, the official reporter of the National House of Representatives, 1st session 1st Congress. This tablet bears the following inscription:

Captain Thomas Lloyd, Author, Soldier, Patriot.
The father of American shorthand reporting.
14 August 1756 — 19 January 1827.

In 1834 Franz Xavier Gabelsberger, secretary to the Ministry in Bavaria, brought out his invention and in 1837 Isaac Pitman, of Bath, England, gave to the world the first edition of phonography or sound hand. Gabelsberger's system, with adaptation, has been widely introduced in Austria-Hungary, Switzerland, Russia, Denmark, Norway, Sweden, Finland, Poland, Holland, Belgium, Serbia and Rumania, although in some of these countries modifications of the Stolzean method predominate. Wilhelm Stolze published his system in 1841 and it is used in the Prussian Chamber, which is the sole exception to the official use of Gabelsberger's shorthand in Germany. In Russia a translation of Gabelsberger is officially employed in the imperial Senate, the Court of Cassation and other law courts. There was, of course, a gradual development of the art down to Isaac Pitman's invention. Dr. Bright's system was cumbrous and followed the vertical style of Chinese writing; but he indicated a present particle by two final dots just as Isaac Pitman nearly three centuries afterward denoted it by one.

Phonetics.—The phonetic principle was first applied to English shorthand by John Willis, in 1602, and it was further developed from time to time; but it remained for Isaac Pitman to make it a complete basis; in other words, to invent phonography or sound hand. As there are in the English language 43 distinct sounds, represented by 26 letters, Isaac Pitman adopted an extended alphabet by which consonants are indicated by simple geometrical strokes, straight or curved, the light sounds denoted by light strokes and the heavy ones by corresponding heavy strokes. The leading heavy vowels are represented by six heavy dots and a like number of heavy dashes, placed at the beginning, middle or end of the strokes and before or after as they precede or follow the consonants. The same course is followed with the light vowels. Diphthongs are provided for by a combination of dash forms and by a small semicircle differently formed and placed in different positions. Circles, hooks and loops are employed in distinct offices. As an illustration, the word *bought* is composed of three sounds represented by six letters. It is spelled phonetically *b aw t*, and in phonography it is written with two straight strokes joined, one sloping and the other perpendicular and a disjoined dash. In rapid writing the dash is omitted, as an important feature of the art in reporting is the use of consonant outlines, omitting vowels. It follows that shorthand is more readily adapted to a consonantal than a vowel language and for this reason French is easy and Japanese difficult. In every case, however, many brief forms, more or less arbitrary, are used for words of frequent occurrence.

Pitman System.—As has been stated, verbatim reporting in the English-speaking world dates from the invention of phonography by Sir Isaac Pitman. In recognition of his eminent service, the honor of knighthood was conferred on him by Queen Victoria. There was a celebration in London in 1887 known as the Golden Jubilee of Phonography, in which an array of talent was displayed which came as a surprise to men of letters on both sides of the Atlantic, who were unaware of the accomplishments nec-

essary to make the career of a shorthand reporter successful. Sir Isaac died in 1897, after having witnessed the introduction of phonography into every land that Anglo-Saxon civilization has penetrated. The inventor received great aid from his brothers, but that of his youngest brother was conspicuous and American. Benn Pitman came to the United States in 1853 and established in Cincinnati a phonographic institute and a publishing house, which are still in successful operation. For many years Pitman had an able associate in the person of Jerome B. Howard. In 1903 Benn Pitman having spent 50 years in the dissemination and development in the United States of his brother's invention, the National Shorthand Association, which met in Cincinnati, made an appropriate celebration of the golden jubilee of his labors.

The following is the complete alphabet of the Isaac Pitman system as presented in "Course in Isaac Pitman Shorthand" (1918).

To these brief elementary signs, which represent every distinct elementary sound in English, are added abbreviating adjuncts and principles that enable the hand to keep pace with thought. When Isaac Pitman invented his shorthand alphabet and with the assistance of distinguished educators and practitioners improved it, he had a three-fold object in view:

1. To give those who had memoranda to make, a more elementary method of writing, plain, simple, easily acquired in a few weeks, and capable of being executed at the rate of 50 or 60 words a minute.
2. To develop a style of writing for the use of business men, ministers, physicians, authors, scientific investigators, and others who would acquire through a few months' study the ability to write 100 words per minute, with the ease of speech and the legibility of print.
3. To establish a system of reporting for those who sought to record the eloquent orations of public speakers at the rate of 300 words a minute when required.

How well the inventor succeeded in his realization of these first two resolves may be seen in the representation in the next column and the history of the dissemination of the art proves that this third has also been crowned with success.

Pitman's phonography has not only been successfully adapted to such languages as the Spanish and Dutch, but even to the Malagasy for official use in Madagascar, and in 1902 Edward Gantlett made an adaptation to the Japanese language under the title 'Phonographica Japonica.' In Japan and China a method of tachygraphy is generally employed. The separate marks which united form a character in ordinary writing are made by a single stroke of the pen, the contours being traced regardless of details. In India, Navina, of the Punjab University, invented an alphabet of new Hindu characters, which is said to form the basis of a rapid and legible system of shorthand. Other systems, based on Isaac Pitman's, have been introduced in the United States by Elias Longley, Andrew J. Graham and James E. Munson. Mr. Graham brought out the first edition of his 'Standard Phonography' in 1858.

SPECIMEN OF ISAAC PITMAN SHORTHAND.

"I wish every man had such an education—every young man especially. And if either of my sons had lived, and I had trained him, as I should have tried to do, to be a great and good farmer, I should have wanted to send him at least six months to a Business School, to give him the aptitude and habits and forms of a thorough Business Man."

Horace Greeley.

Official Use.—The enlarged use of shorthand, owing to the demands of State legislatures, courts and the business world, is well known. The National Shorthand Reporters' Association has an executive committee composed of reporters from 35 States, 2 Territories and the District of Columbia. (See SHORTHAND STANDARDIZATION). The Senate of the United States in 1848 made a contract for a verbatim report of its debates and proceedings and the same course was adopted by the House of Representatives in the following year. Before 1848 the *Congressional Globe* contained an abstract of the debates and such speeches in full as members wrote or had specially reported. In 1873 Congress adopted the existing method and transferred the official publication of the proceedings from private contract to the government printing office. By this method each house employs a corps of five

reporters, the Senate paying to its corps \$25,000 a year and the reporters of the House receiving \$5,000 a year each. In addition, the House of Representatives employs a corps of official reporters of committees.

Shorthand has reached the highest possible development in every country where a parliamentary form of government has obtained. Turkey possessed no system of shorthand until her accession to the list of constitutional states, brought about by the reform movement of 1876. The Turkish Parliament met in 1877 and much difficulty was found in securing reports. Stenographers were employed to translate on the spot into French the speeches delivered in Turkish, but in this work the note-takers failed. The speakers were then required to reduce their remarks to writing before delivery; but it was found that such a rule could not be applied to a deliberative body. Efforts were then made to invent a stenographic machine, but this proved a failure there as elsewhere. Gabelsberger's system subsequently was translated into Turkish by Grünbaum.

The Continental countries of Europe, Great Britain and the United States now make instruction in shorthand a material and essential part of education.

CLARENCE A. PITMAN.

SHORTHAND, Science of. Shorthand Empiric.—Modern shorthand has developed from the earliest times down almost to the present day (1919), wholly as an empiric art, lacking those standards of measurement and accompanying definition of terms which constitute the first essential of any science—a striking anomaly in this scientific age.

Resultant Confusion.—As a direct consequence of this condition more than a thousand different systems of shorthand have been published for English alone, which for longhand has in effect but one. No less striking is the fact that those systems most prominent in the United States to-day differ not only in their specific alphabets and outlines and minor rules but also in their most fundamental conceptions of the nature and use of shorthand material—differences as marked as though the steam railroads of the country should run on one rail or three while the electric rapid transit of the cities ran on two.

Controversial Data.—This lack of recognition of scientific principles which, recognized or not, must underlie the practice of any useful art, has developed an immense mass of controversial literature, in which system A is compared with systems B and C, or system X with systems Y and Z, always to the latter's disadvantage—each document conclusive and final in itself, but each directly and irreconcilably contradictory to the other. The inevitable result of this futile recrimination has been to increase rather than decrease confusion and strife, and to make organized scientific progress impossible.

Efforts to Formulate Science.—Various attempts have been made in the past to determine the basic principles which, systematically related, constitute the science of shorthand as distinct from the practice of the art. Of these, the most noteworthy was the formation of The Shorthand Society in London in 1881, with the avowed purpose of "the study of the

science and literature of shorthand and the investigation and discussion of the principles which should govern the construction of systems of shorthand and abbreviated longhand, adapted, if possible, for general use." The transactions of this society (50 numbers of the magazine *Shorthand*), which lasted for a dozen years till disrupted by the factional strife of system partisans, contain many sincere efforts to establish such basic general principles of shorthand—unfortunately in most cases too specific in their application to particular types of systems to have the general value for which they strove.

The outstanding feature of the society's efforts is undoubtedly the work of Edwin Guest, 1836-1880) which reached the point of propounding and roughly grouping 49 genuinely single and separate propositions and definitions under the general head of "Shorthand principles worthy of general acceptance," before further organized progress was suspended by the disintegration of the society.

Equally able and sincere though less detailed is the notable paper of Prof. J. D. Everett, "On the principles that govern the construction of a system of shorthand," read before the 1887 International Shorthand Congress at London. Various other statements have been put forth in the name of shorthand science, but with rare and fragmentary exceptions they prove on examination to be at best a list of unsubstantiated personal opinions, at worst a catalogue of personal prejudices.

Science of Shorthand.—The science of shorthand, presented before the 1918 convention of the New York State Shorthand Reporters Association, the oldest shorthand organization of America, as a part of the work of the Committee on Shorthand Standards marks the first systematically comprehensive formulation of the fundamental principles of shorthand science. It is an attempt to classify, define and where necessary discuss the single separate factors involved in the construction of any shorthand system, so far as they could be ascertained by reading, conference or original research; with out regard to their bearing on any particular system past, present or future. Although necessarily neither complete nor final it may be considered substantially correct as far as it goes and sufficiently complete to be accepted as a guide.

Structure.—The propositions of the science are classified under seven heads: 0 General considerations; 1 Phonetic or sounds; 2 Geometric or signs; 2:1 Assignment of signs to sounds; 3 Manual of writing; 4 Visual or reading; 5 Mental or remembering.

Each main head is subdivided into three classes: (a) Axioms and definitions—which should involve no scientific controversy at the present time; (b) Canons—which are considered proven or demonstrable but recognized as still subject to controversy in greater or less degree; (c) Theorems—put forward rather for discussion and investigation than for immediate acceptance.

The direct work of the science has been supplemented by extensive researches giving the relative frequency of every sound and the commoner syllables and words of English, and is being further supplemented by various experimental data on the relative facility of the possi-

ble signs and sign combinations of shorthand writing and their relation to penmanship technique. Much more remains to be done, but the work is going forward under the direction of the leading State and national associations.

Limitations.—Students of shorthand science will be struck by the absence from the science of any specific pronouncement on such leading questions of shorthand as: Whether to shade or not to shade stems; Whether to write stems on two, three or four distinct slopes; Whether to use the appendages for primary representation of vowels or for secondary representation of consonants. This is because such questions are not single separate factors of any shorthand problem, but are each a complex of a dozen or more important and inter-related factors, so that to pass judgment on such decisions would easily become dogmatic and enormously restrict the scope and usefulness of the science.

Purpose.—The purpose of the science of shorthand is to provide those standards of measurement and their accompanying definition of terms essential to scientific shorthand progress; to be used analytically to determine the strength or weakness of existing systems, or synthetically to determine the construction of future shorthand systems.

Specific Propositions.—A few of the more important propositions of the science, illustrative of the plan and scope, are given below. The complete series to date (1919) is accessible in the 1918 Proceedings of the New York State Shorthand Reporters Association. The first figure of each number refers to the main head noted above, the letter to the sub-class. The second figure is a serial number in each sub-class, for convenient reference.

0 a 4. No system of shorthand can conceivably be *best* in every important point, for several of the most important basic features are mutually incompatible. "Every fair minded person who has paid any attention to the relative merits of different systems, or who has himself tried his hand at system-making, knows that the best result can only be attained by judicious compromise. One advantage cannot be obtained in its highest degree without the sacrifice of other advantages, and no sound judgment can be arrived at by setting up one particular point of superiority as the sole test of excellence." (Everett).

0 b 8. "Time, not space, is the proper measure of brevity." (Guest).

1 a 1. The total number of different sounds in spoken English can no more be determined than the total number of different colors in the spectrum, and for the same reason—that they blend into one another by imperceptible degrees or shades.

1 a 2. A minimum number of sounds necessary to be distinguished for phonetic writing of English may be and has been conclusively determined. This minimum number is 40, counting diphthongs. (See table of comparative alphabets under SHORTHAND).

2 a 1. The simplest conceivable material for graphic purposes is composed of right lines and arcs of simple curves, whether of circular, elliptic or other assumed origin.

2 a 6. The principal material for modifying or supplementing the simplest straight and curved stems consists of circles, hooks and loops, small and large, initial and final, and, in

the case of straight stems particularly, right and left.

2:1 a 2. Latham's second law: "2 That sounds within a determined degree of likeness be represented by signs within a determined degree of likeness; whilst sounds beyond a certain degree of likeness be represented by distinct and different signs, and that uniformly."

2:1 b 1. (Assignment of signs to sounds in a simple shorthand for general use). Must not suggest by geometric similarities phonetic relations contrary to fact.

3 a 2. The relative ease of the various strokes which are possible material for shorthand writing will be profoundly affected by the muscles chosen to perform the principal effort and control of writing, and by the position of holding the pen or pencil. It is therefore essential that instructions for pen position and muscles to be used be adapted to each other, and to the genius of the system to be written; or, conversely, that in the construction of a shorthand system these points be determined in advance of its analysis of other data.

3 a 4. Other things being equal, a shorthand which employs symbols of *only* one length, one thickness or one position, will be more *facile* than a system employing symbols of more than one length, thickness or position. In practice observation of all three of these restrictions would make impossible the condition of "other things being equal."

4 a 2. Other things being equal, a shorthand which, within the limits of clear distinction, employs symbols of *more than* one length, one thickness or one position, will be more *legible* than a system employing symbols of only one length, thickness or position.

5 a 1. "Rules should be simple, comprehensive, logical, and as nearly as possible free from exceptions." (Guest).

5 a 2. The less of a word or phrase is expressed or implied the more of it must be remembered.

5 a 6. Arbitrary abbreviations are always objectionable, but are least objectionable in words of most frequent occurrence; for the double reason that their economy is so much the more valuable, and their meaning so much the more readily remembered.

5 b 2. Words are most readily recognized by their first elements, next by their last elements and least by their middle elements.

Thoughtful consideration of these and similar factors, studying their inter-relations and weighing their relative importance for the particular purpose in view, will go far toward assuring a more rational and constructive development and progress for the shorthand of the future.

GODFREY DEWEY,

Honorary Member of the National Reporters Shorthand Association.

SHORTHAND STANDARDIZATION.

In 1909 the National Shorthand Reporters Association appointed a committee "to standardize verbatim shorthand reporting, putting it on a thoroughly scientific basis." This committee, accepting as a starting point those signs and principles common to all Pitmanic shorthand systems, has given 10 years of arduous and unremunerated toil by some of the best reporters of the United States and Canada to

comparison and selection of reporting expedients and word and phrase outlines, in the effort to make of Pitmanic shorthand the most perfect instrument yet devised for the purposes of the verbatim reporter. It is hoped that the results of the committee's labors, now nearing completion along this particular line, may be made available in the near future (1919) by publication under the auspices of the association.

SHORTHORN, a breed of cattle. See Ox.

SHORTHOUSE, Joseph Henry, English manufacturer and author: b. Birmingham, 9 Sept. 1834; d. London, 4 March 1903. After a secondary education at Tottenham, he became a manufacturer of sulphuric acid at Birmingham, but soon found his calling in literature, and privately printed a half-mystical work of fiction, 'John Inglesant.' This was published in 1881, was much talked of and gained a solid success. Other works of his, such as 'The Little Schoolmaster Mark' (1883-84) and 'Sir Percival' (1886), did not encounter a similar acceptance, but are greatly prized by thoughtful readers. Besides his fiction he wrote an essay on 'The Platonism of Wordsworth' (1882). See JOHN INGLESANT.

SHORTIA, a genus of plants of the *Diapensia* family, containing two species, one (*S. uniflora*), in Japan, and the other a very local plant, in the Alleghany Mountains. The latter species (*Shortia galacifolia*), is an interesting plant, historically, being closely associated with Dr. Asa Gray. When in Paris in 1839, Dr. Gray saw an unnamed specimen, with only leaves and fruit, in the herbarium of the elder Michaux, who stated that he had collected it in 1788, in the high mountains of Carolina. Dr. Gray afterward searched for it in that region, but was unsuccessful. He, however, described this plant, "with the habit of *pyrola* and the foliage of *galax*," and named it in honor of Dr. C. W. Short. The *Shortia* was afterward found (1877), although not in the locality mentioned by Michaux, but was in flower and was sent to Dr. Gray to verify his classification. In 1886, almost 100 years after it was first seen, and after much laborious searching, the *Shortia* was rediscovered by Dr. Sargent, in practically the identical region visited by Michaux. Later still it was found in such quantities that it was transplanted, and this once unknown flower is now becoming a common plant in horticulture. It has a creeping rootstock, a large tuft of long-petioled, evergreen leaves, with brownish stains, thin and serrate and shaped very like the *galax* leaves used in floral decorations. There are several flower scapes, some six inches tall, bearing solitary nodding, five-parted, bell-shaped flowers an inch long and wide, with white-fringed petals, blooming in the early spring.

SHORTSIGHTEDNESS. See VISION, DEFECTS OF.

SHORTT, Adam, Canadian political economist: b. of Scottish parentage, near London, Ontario, 24 Nov. 1859. He was educated at the universities of Queen's (Kingston, Ontario), Edinburgh and Glasgow, and on his return to Canada became an assistant in philosophy at Queen's University, and after the establishment

of the Macdonald chair of political science at Queen's was appointed to fill it. He became Dominion Civil Service Commissioner in 1908 and was created C.M.A. in 1911. He made a close study of Canadian economic problems as well as of English and French Colonial policies, and published in the *Journal of the Canadian Bankers' Association* a series of papers on the 'History of Canadian Currency' and 'Banking and Exchange.' His other writings include 'Imperial Preferential Trade, from a Canadian Point of View' (1904); 'Report on Railway Taxation for the Ontario Government' (1904); 'Documents Relating to the Constitutional History of Canada, 1759-61' (1907); 'Life of Lord Sydenham' (with A. G. Doughty, in 'Makers of Canada' series, (1908).

SHOSHONE (shō-shō'nē) **FALLS**, a waterfall of the Snake River (q.v.), in the south of Idaho, about 30 miles south of Shoshone. Above the falls proper, the cañon is about 750 feet wide and 1,200 feet deep. The waters are deep and flow with scarcely a ripple until the rapids are reached, when the water spreads out fan-like and drops over numerous precipices, some 50 feet in height, then, as it were, gathers its entire volume and plunges over a precipice 210 feet in height. Below this fall the cañon is about 1,000 feet in depth. Four miles higher up are the Little Shoshone Falls, a broken cataract of 182 feet.

SHOSHONEAN INDIANS (adapted from *Shoshoni*, an important Shoshonean tribe, whose name is probably an opprobrious Siouan epithet), a linguistic stock of American aborigines which formerly occupied a large part of the great interior basin of the United States. On the north, Shoshonean tribes extended far into Oregon, where Shapshian territory was met. On the northeast the eastern limits of the pristine habitat of the Shoshonean tribes are unknown; the narrative of Lewis and Clark asserts that the Shoshoni bands encountered on Jefferson River, whose summer home was on the headwaters of the Columbia, formerly lived, within their own recollection, in the plains east of the Rocky Mountains, whence they were driven to their mountain retreats by the Minitari (Atsina), who had obtained firearms, and much of whose territory was formerly occupied by Shoshonean tribes. Later a division of the Bannock held the finest portion of southwestern Montana, whence they were apparently being pushed westward across the mountains by Blackfeet. On the east the Tukuarika, or Sheepeaters, held the Yellowstone Park country, while the Washaki occupied southwestern Wyoming. Nearly the entire mountainous part of Colorado was held by the several Ute bands, including the northern drainage of the San Juan in the southeast and extending into northeastern New Mexico. The Comanche division of the stock extended farther eastward than any other, but with the exception of the Penetehka band, this important and warlike tribe did not make its appearance in the southern plains until the beginning of the 18th century, although they later extended their raids throughout the greater part of Texas and far into Mexico. On the south, Shoshonean tribes were limited generally to Colorado River in Arizona and California; the Chemehuevi occupied both banks of that stream above and below Bill Williams

Fork, and the Kaibabs, Shivwits and Kwaiaantik-wokets (Paiute divisions) occupied northwestern Arizona and southwestern Utah. The pueblo-dwelling Hopi or Moki occupied seven villages in northeastern Arizona in the middle of the 16th century, some of which were subsequently abandoned and new ones established, and about the close of the 17th century Tewa Indians of Tanoan stock from the Rio Grande established the pueblo of Hano among the Hopi (see TUSAYAN). In the southwest, Shoshonean tribes had pressed across California, occupying a wide belt of country to the Pacific. In their extension northward they had reached as far as Tulare Lake, from which territory they had apparently dispossessed Mariposan tribes. A little farther northward they had crossed the Sierras and occupied the heads of San Joaquin and Kings rivers; they also occupied nearly the whole of Nevada, and the entire southeastern part of Oregon was likewise inhabited by tribes of Shoshonean extraction.

Owing to the vast extent of country occupied by these tribes, which ranged from timbered mountains to desert plains, with great difference in climatic conditions, their habits and customs greatly varied. The northern and eastern members of the stock—the Bannock, Shoshoni, Ute and Comanche—were hunting Indians, living in tipis and subsisting almost entirely on large game, including the buffalo; but of these tribes only the Comanche were essentially "Buffalo Indians." Most of the western tribes of the stock, notably the Piute, inhabited in the main an inhospitable desert region which afforded scant subsistence in the way of seeds, berries, roots, fish and small game. The necessity of digging roots for food early earned for them the sobriquet "Diggers," a name still applied to the Piutes and their relatives in eastern California, western Nevada and western Utah, particularly those not under official control. Living in rude brush shelters or sometimes even in holes in the ground, and subsisting on the meagre natural products of the desert, these Indians have been regarded as, in some respects, among the lowest in the culture scale of the tribes of the United States, although some of the Piute divisions and the Chemehuevi practise agriculture to some extent. The Hopi or Moki, whose country in northeastern Arizona was the province of Tusayan (see TUSAYAN) of the early Spaniards, are much farther advanced than any of the Shoshonean tribes, due probably to a large infusion of eastern Pueblo and other foreign blood; they live in permanent adobe houses, have a highly developed social and religious system, successfully cultivate the sandy soil and have earned just renown as potters, weavers and basket-makers.

Owing to the fact that various Shoshonean tribes have been long in contact with the white races and that they had themselves advanced pretty well along the road to civilization before the system of Indian reservations came into vogue, many of the Shoshoneans have never been placed on reservations, and their modern descendants have so identified themselves with the life of the nation that it is difficult to make clear their tribal relationship. This is especially so of the Piute and the Pueblo dwellers in general. An estimate of Shoshoneans place them at over 21,000, distributed as follows:

Bannock 600, Chemehuevi 500, Comanche 1,500, Hopi 2,000, Towa 1,200, Piute 7,000, Shoshoni 3,300, Tobikhar 2,300, Ute 2,600. This estimate does not include very small tribal remnants, numbering about 100 or less. The modern scientific view of the Shoshoneans is to consider them a part of a still larger family which includes the Aztecs and related tribes of Mexico. For a description of the various tribal divisions of the Shoshoneans, see PUEBLO; BANNOCK; COMANCHE; UTE; CLIFF DWELLERS.

SHOT. See PROJECTILES.

SHOTGUN, a small-arm with smooth bore, used for firing a charge of small shot in hunting wild fowl and small animals. It may have one barrel or two, and is called accordingly single-barreled or double-barreled. Two other types are recognized: the muzzle-loader and the breech-loader. The former type is no longer manufactured, but many such firearms of the olden time are still in existence, and hold their own in accuracy and effectiveness with the most carefully made modern weapons of this class.

The forerunner of the shotgun was the old-time blunderbuss, with its spreading wide-mouthed barrel devised to scatter its handful of miscellaneous missiles over as large an area as possible, with still enough striking force in them to accomplish its purpose. It had a range of about 100 feet. The shotgun of to-day has but little longer range (40 yards) but delivers its charge in a more condensed group and with the expenditure of considerably less powder.

The principal parts of a shotgun are the barrel, the frame and the stock. The necessity of having a barrel sufficiently strong to withstand the force of the powder explosion and at the same time provide a weapon not too great in weight to be comfortably carried about for a day's sport led to an ingenious plan by which the force released might be controlled by the greater lengthwise resistance of the fibres in a rolled bar. Wrought iron and steel strips were laid alternately and twisted together, and then wound in a close spiral around a rod-like mandrel. This spiral was then heated and welded into a solid tube, which was afterward bored out as to the inside and turned, "browned" with acid and polished on the outside, then presenting the peculiar grain which marked the "twist" or "Damascus" barrels so familiar a generation ago. The success of these light tubes in withstanding the sudden bursting pressure to which they were subjected developed another difficulty; the gun was too light to take up a sufficient part of the recoil to render its use agreeable. This fault was happily remedied by adding another barrel, which not only

brought the weapon to an adequate mass, but afforded the huntsman the opportunity of a second shot.

Following the invention of breech-loading mechanism for rifles, this improvement was adapted to the shotgun by the device of "breaking" the barrels on a hinge-joint at the frame, so that the open butt of the barrel was presented for the insertion of the cartridge. The leaking of the gases of explosion, however, called for further improvement, and this was secured by the invention of an expanding shell for the cartridge. The force of the exploding powder automatically expands this shell so snugly into the breech chamber that all leakage of gas is prevented.

The next advance, the hammerless gun, was also the result of an improvement of the cartridge so that a centre pin could be used to explode the charge. The rim-fire cartridge thereupon disappeared and with it the projecting hammers.

Another important improvement of the shotgun had progressed contemporaneously with those already noticed; the introduction of the choke bore. While choke-boring had been invented as early as 1781, it was not definitely adopted until 1866. It consisted in contracting the gun-barrel slightly near the muzzle for the last few inches of its length—in some cases for five to eight inches, in other makes for two or three inches. Some gun manufacturers taper the choke to a conical form; others introduce a shoulder with gently rounding curves a few inches from the mouth; and there are several modifications of these practices. In the straight-barreled or non-choking gun only 30 per cent of the shot in the charge reach a target 30 inches in diameter at a distance of 40 yards. With the choke-bore barrel (other things being equal) 70 per cent of the shot is delivered upon the 30-inch circle. The explanations of this result have been many, but the one generally accepted is that the choke momentarily holds back the wad, and with it the forcibly expanding gases which otherwise have a tendency to scatter the shot laterally just as they leave the muzzle. Gun barrels are made "full-choke" or "modified choke." In a 12-gauge gun the bore is 0.730 inch; with full-choke the mouth is narrowed to a diameter of 0.695 inch; with modified choke, to 0.716 inch.

The modern gun is of 10, 12 or 14 gauge, double-barreled, breech-loading and hammerless. It may have two triggers, one for each barrel, or but one trigger, a second pull on which fires the second barrel. The pull on the trigger is gauged from three to six pounds, less than three pounds being considered dangerous. The great majority of the American guns of the present day have barrels of forged steel. The bar from which a barrel is to be made is first rough-bored, then rough-turned on the outside and then straightened by hammering. It is then turned again and ground on a broad-faced stone. The lug is then brazed on. The inside of the barrel is then reamed out several times up to the choke, and this is shaped by special reamers according to the pattern desired. The two barrels selected to be associated in the double-barreled gun are tinned along their adjacent sides and blocks of metal are placed between them to keep them at the proper dis-

tance apart, the centre lines of the muzzles converging three-sixteenths inch for 30-inch barrels. The ribs are then soldered into the rabbets prepared for them. The stock of the gun is of walnut, Circassian walnut being favored for fine guns. The frame is of steel and serves to connect the barrels to the stock as well as to house the lock mechanism. The gun may also be a repeater, firing several shots in quick succession from a magazine lying under the barrels. A well-made gun of 12-gauge will weigh from five and one-half to seven pounds, depending upon the work expected from it.

Military Shotgun.—The military shotgun used by the American army in the Great War for night expeditions in "No Man's Land" and in clearing up trenches has a barrel 20 inches in length and carries a bayonet. It is of the repeating type, firing six times before reloading. The charge is of nine buckshot, and its shooting qualities are exceptional. Upon a life-sized manikin, at 30 yards all nine of the shot hit the target; at 50 yards the hits ranged from four to eight; at 80 yards, two to four hits; at 100 yards, always one hit and often two.

W., 'The Gun and Its Development' (London 1907); Kephart, H., 'Sporting Firearms' (New York 1912); McKee, T. H., 'The Gun Book for Boys and Men' (New York 1918); Money, A. W., 'Guns, Ammunition and Tackle' (New York 1904).

SHOTWELL, James Thomson, American historian: b. Strathroy, Ontario, Canada, 6 Aug. 1874. He was graduated at Toronto University in 1898 and took his Ph.D. at the University of Columbia in 1902. He has been connected with the faculty at Columbia since 1900 and since 1907 has been professor of history there. He was assistant general editor of the 'Encyclopedia Britannica' in London in 1904-05. He also edited 'Records of Civilization' (20 vols.). Author of 'Sources and Studies' (3 vols., 1915-16). He was a member of the American mission which accompanied President Wilson to the Peace Conference in Paris in 1919.

SHOULDER-GIRDLE. See **SHOULDER-JOINT**.

SHOULDER-JOINT, the articulation of the upper arm or humerus with the glenoid cavity of the scapula or shoulder-blade. This joint is an example of the enarthrodial or ball-and-socket joints; the ball-like or rounded head of the humerus working in the shallow cup of the glenoid cavity. The head of the humerus is very large when compared with the glenoid or receiving cavity. The capsule which surrounds and encloses the joint is of very loose nature, but is intimately connected with the muscles which are attached to the head of the humerus. The joint itself is guarded against dislocation or displacement by the strong ligaments surrounding it, as well as by the tendons of its investing and other muscles; while superiorly the acromion and coracoid processes of the scapula form an arch, together with the coraco-acromial ligament, which further serves to protect the joint. The shoulder arch or girdle, also called pectoral arch or girdle, is in vertebrates

—in mammals, none above monotremes (see *MONOTRAMEATA*)— usually attached to the sternum ventrally, and to it the fore limbs are articulated. It has only an indirect connection with the vertebral column. Rudimentary or greatly modified in the majority of mammals, this girdle is especially marked in certain groups of birds (see *ORNITHOLOGY*). In man the clavicle is completely developed, and with the scapula this forms the bone-structure of the shoulder-girdle, which, relatively, is endowed with superior strength.

The articulating surfaces of the shoulder-joint are covered with cartilage. The capsular ligament forms the chief ligamentous structure. It serves chiefly to support the inner and upper portion of the glenoid ligament, which is fixed around the margin of the cavity of that name. Its function is chiefly that of deepening the cavity by adding to its circumference, and it also protects the bony edge of the cavity. The motions of the shoulder-joint are limited and controlled by the interlocking of the bones, as well as by the tension of the capsule. The biceps muscle, in the relations of its tendons to this joint, subserves several important uses. Primarily, and from its connection with both elbow and shoulder-joints, it brings the movements of both into harmonious relation; while it strengthens the upper portion of the articular cavity and steadies the head of the humerus, through its relation to the bicipital groove of that bone.

This joint is liable to various diseases and injuries. Local injury may result in inflammation, while diseased conditions of constitutional origin may give rise to strumous or scrofulous disorders of the joint, to syphilitic lesions and gouty or rheumatic attacks. Of the accidents to which the joint is liable, dislocations are by far the most frequent, while fractures are not uncommon. Fracture of the acromion process of the scapula, of the coracoid process, of the neck of the shoulder-blade and of the upper part of the humerus are of most common occurrence among these accidents.

SHOVEL-NOSE. See *STURGEON*.

SHOVELLER, or **SPOONBILL**, a freshwater duck (*Spatula clypeata*), distinguished by the bill being longer than the head and narrowed at its base, while the tip is hooked and broadened and its fringe-like processes are long and slender. The average length of this bird is about 18 or 20 inches. The male has the head and upper neck bright green, and the lower neck white. The scapular feathers are white. The back is brown, the primary wing-feathers blackish-brown. The tip of the wing is pale blue, as also are the wing-coverts. The tail and upper tail-coverts are black. The breast and belly are light brown or chestnut. It feeds on worms, insects, snails, small fishes and vegetable matters and inhabits lake-margins and marshy spots and breeds numerously all over the northern half of North America as well as in northern Europe and Asia, making its nest on the ground.

SHRADY, **George Frederick**, American surgeon and editor: b. New York, 14 Jan. 1837; d. 30 Nov. 1907. He studied at the College of the City of New York and took his M.D. at the College of Physicians and Surgeons, New York, in 1858. He was United States acting

assistant surgeon in the Civil War. He was consulting surgeon to the Saint Francis, the Columbus, the General Memorial and the Health Department hospitals in New York, and was consulting surgeon in attendance upon General Grant in his last illness. He edited the *American Medical Times* in 1860-64, and in 1866 founded the *Medical Record*, which he edited until his death.

SHRADY, **Henry Merwin**, American sculptor: b. New York, 24 Oct. 1871. He was graduated at Columbia (1894), studied law, went into business and, finally taking up sculpture as an amateur, developed himself, without the direction of any teacher, into a professional sculptor, being successful in a competition for the execution of an equestrian statue in Brooklyn (\$50,000) 1901; of the 'Grant Memorial' for Washington (\$250,000) 1902; while he was subsequently commissioned by the Holland Society of New York to make an equestrian statue of 'William the Silent.' His later works include equestrian statues of 'General Williams' (Detroit); 'General Lee' (Chancellorsville, Va.), and a statue of 'Jay Cooke' for Duluth, Minn.

SHRAPNEL. See *PROJECTILES*.

SHREVE, *shrēv*, **Henry Miller**, American inventor: b. Burlington County, N. J., 21 Oct. 1785; d. Saint Louis, 6 March 1854. Early in life he engaged in navigation on the Western rivers, and in 1815 ascended the Mississippi to Louisville, Ky., in the *Enterprise*, the first river steamboat. In 1820 he built the *Washington* of 400 tons burden; remodeled it in 1824, so as to operate each of the side wheels with a separate engine; invented the snag boat *Heliopolis* for removing snags from rivers, and in 1829 patented a steam battering ram for harbor defense. In 1826 he was made superintendent of improvements in Western rivers and continued in that office till 1841.

SHREVEPORT, La., the second largest city of the State and the seat of government of Caddo Parish, located in the northwestern section of the State, 18 miles from the Texas line and 170 miles east of Dallas, at the head of navigation on the Red River and on eight railroad systems, including the Texas and Pacific, the Saint Louis Southwestern, the Kansas City Southern, the Houston and Shreveport, etc. The city is the centre of a large territory rich in oil, gas and agricultural produce. It contains the Louisiana State Fair grounds, Saint John's College, Centenary College, Saint Vincent's Convent, Saint Mary's Convent, Youree Hotel, Charity Hospital, Genevieve Orphanage, post office, city hall, courthouse, schools and churches. There are three national banks, two State banks and two trust companies, with combined capital and surplus of about \$3,000,000. Parks owned by the city include Princess, Schumpert, Lakeside and Currie Playground. The city has a very large trade in hardware, lumber, groceries and dry goods. Its industrial establishments include cotton factories and compressors, foundries, glass and bottle-works, lumber mills, machine shops, silo factory, stave and barrel plant, oil refining, etc. The total trade has an annual value of about \$75,000,000. Pop. 41,133.

SHREW, one of the minute mammals of the family *Soricidae* and order *Insectivora*, particularly the Common (*Sorex vulgaris*) and the

Lesser Shrew (*S. pygmaeus*). The former are about the size of a mouse, which it somewhat resembles in the shape of the body, feet and tail, but has the muzzle produced far beyond the lip. The shrews have hairy mouse-like bodies and ordinary feet formed for running, and not for burrowing, as in the allied moles; the eyes and ears are comparatively well developed. They live on the ground, though a few are arboreal and others aquatic. The jaws are prolonged and a mobile snout generally exists. There are six upper and four lower incisors, the middle pair of the upper jaw being long and curved. The first lower incisors project horizontally and form with the upper ones a forceps-like structure for the grasping of small insects, which form the larger part of their fare. This family is much the largest one of the Insectivora and the numerous species are found in most parts of the world and present many interesting adaptations.

Within the limits of the United States four genera and about 60 species occur. In the typical genus *Sorex* the ears are large and of normal conformation and the feet are not fringed with stiff hairs. The common shrew is a frail little creature less than three inches long with a scantily-haired tail measuring one inch and may readily be distinguished by its prolonged muzzle and by the teeth being colored brown at their tips. It feeds upon insects and their larvæ and inhabits dry places, making a nest of leaves and grasses. The young, numbering from five to seven, are born in the spring. These little animals are very voracious in their habits and frequently kill and devour one another. *Neosorex* has large feet fringed with stiff hairs and includes the large water shrew, six inches long, as well as several other species. It lives in burrows leading to the water, which it enters in search of snails, etc., upon which it largely feeds. This species is found chiefly in the Rocky Mountain region and central plateau.

Blarina is a characteristically American genus with mole-like fur and the external ear well developed but turned forward in such a manner as to cover the opening and conceal itself among the hair. The short-tailed or mole shrew (*B. brevicauda*) is the best-known species of shrew in the eastern United States. It is about four and one-half inches long with a hairy tail measuring one inch. In general habits it resembles *Sorex*. During the winter it remains quite active and is frequently found on the surface of or burrowing in the snow. At this season it feeds largely on beechnuts as well as hibernating chrysalids and larvæ. It is a bloodthirsty creature and when confined attacks and devours its own kind as well as mice larger than itself. Like other shrews it has upon the knees and elbows glands, the secretion of which give it a peculiar and disagreeable odor.

Among interesting exotic species the following may be mentioned: the European and Asiatic water shrew (*Crossopus fodiens*) attains a total length of from four and one-half to five inches. The fur is of delicate texture and adapted to resist the action of water. A prominent fringe of stiff white hairs is found on the tail as well as the toes of this form, this fringe forming a distinctive feature of the species. The teeth are also fewer than in the American water shrew.

The food resembles that of the common shrew, but aquatic larvæ and the young of fishes appear to form a large part of its nutriment. They are of very active habits, diving and swimming with great facility. The musk-shrew (*Crocidura caerulea*) of India is remarkable for the strong musky odor which emanates from glands situated on the sides of the body. It enters houses at night to feed upon cockroaches. Resembling the *Soricidæ* are the elephant-shrews (*Macroscelidæ*). They have the zygoma and auditory bulla developed and the muzzle forms a slender, proboscis-like organ with the nostrils at its tip. The eyes are of moderate size and the ears well developed and covered with hairs. The fore feet are short and possess five toes, while the hind legs and feet are very long and are provided with compressed claw-like nails. The tail is elongated and slender. The elephant shrews or jumping shrews are confined to Africa. The favorite attitude of these creatures is a sitting posture, much resembling that of the jerboas and kangaroos, and from the greater length of the hind as compared with the fore limbs they also, like these animals, progress by leaping. They inhabit dry rocky situations, feed on insects and other small Invertebrata and are nocturnal. Consult Dobson, 'Proceedings Zoological Society' of London (1890); Dobson, 'Monograph of the Insectivora' (London 1882-90); Merriam, 'Mammals of the Adirondack Region' (New York 1884); and Merriam and Miller, 'North American Fauna No. 10' (Washington 1895).

SHREW-MOLE, a large mole (*Scalops aquaticus*) inhabiting wet meadows and the borders of marshes and streams throughout most of North America. See MOLE.

SHREWSBURY, shrooz'bū-rī, England, the county-seat of Shropshire, on the left bank of the Severn, 42 miles northwest of Birmingham and 163 miles northwest of London. The town is unusually picturesque. The bridges are interesting features, four of them spanning the river, which here takes a winding course around the hills. The streets are narrow and steep and bordered by old frame houses. An archway of the period of James II and two towers of the reign of Edward I are parts of the old castle built by Roger de Montgomery. Saint Mary's, an interesting church of the 10th century; Saint Giles'—dates from the reign of Henry I;—Holy Cross, early Norman, and Saint Alkmunds are the most noteworthy churches. The other public buildings are public halls, museum, free library, market-house—including corn exchange—barracks and Royal Grammar School. The industries include glass-staining, agricultural implements, foundries, tobacco, tanning and brewing. Pop. about 30,000.

SHRIKE, or **BUTCHER-BIRD**, a bird of the passerine family *Laniidæ*, and especially of the typical group *Laniinæ*; several other sub-families are not represented in North America. The true shrikes have the bill broad at the base, and hooked and toothed at the tip, resembling the bill of a bird of prey. A dense tuft of bristles surrounds the nostrils and others project from the base of the bill. The feet are small, and, except for the laterally scutellate structure, are of typically passerine type. The shrikes feed chiefly upon insects, reptiles, small

mammals and small birds and their young. About 200 species of shrikes are found in all parts of the world, and four species of *Lanius* within the United States. Other individual names are the Great Gray Shrike (*L. excubitor*), the Lesser Gray Shrike (*L. minor*) and the Red-backed Shrike (*L. colluris*), the latter, like *L. septentrionalis*, being often called the Nine-killer Shrike. The loggerhead shrike (*L. ludovicianus*) is the usual summer species of the eastern United States, where it is resident southerly and migratory in the North. These birds are seen usually in pairs flitting about the borders of woods and along fence-rows. The food consists chiefly of insects which the male is said sometimes to impale on thorns. They also attack the young of other birds. The nest is generally built in bushes and is of large size and composed of grass and weeds lined with hair and feathers. The eggs, usually five in number, are white, tinted with green and spotted with brown of various hues. The loggerhead shrike is eight or nine inches long, slate-colored above and plain ashy white below, with a black stripe through the eyes and meeting across the forehead. In the West it is replaced by two sub-species, the white-rumped and the California shrikes.

The Great Northern shrike (*L. borealis*) is found in the United States only in winter and breeds in British America. It is 9 to 10 inches long, marked below with numerous fine, wavy, dusky lines and the eye stripe is interrupted on the forehead. The nest is built in trees and the four to six eggs are similar to those of the loggerhead shrike. The song is harsh, but this bird possesses considerable imitative powers. The food consists of mice, shrews, insects and in winter especially of small birds. This species especially has a habit of suspending its prey upon thorns or fence splinters, or in forks of tree-branches. The significance of this remarkable habit is not understood. By some it is believed to be a storage of food; by others only an effort at convenience in eating the prey.

Closely related species of shrikes with similar habits occur in Europe and more distinct ones in other countries. The *Oreæca cristata* of Australia lives chiefly on the ground and is noted for its peculiar and somewhat ventriloquial song, which begins with low notes and gradually increases in height and power so as to delude the hearer into fancying that the songster has been gradually coming from a great distance toward him. It is sometimes called the bell-bird. The piping-crow (q.v.) and the pied crow-shrike (*Strepera graculina*), of New South Wales, represent a distinct sub-family. Various other birds have been named "shrikes," of which the most important are the bush-shrikes which belong with the ant-birds in the family *Formicariidæ*. Consult Gadow, 'Catalogue of the Birds of British Museum,' Vol. XV (London 1890); Evans, 'Birds' (London 1900); Newton, A., 'Dictionary of Birds' (New York 1896).

SHRIMP, a small decapod crustacean (see DECAPODA; CRUSTACEA) of the genus *Crangon*, allied to the lobster, crayfish and prawn. They inhabit sandy coasts and in Europe are caught for market in immense numbers by nets when swimming about near the beach at high tide. The familiar species, *C. vulgaris*, about two

inches long, greenish-gray dotted with brown, is esteemed as an article of food. A related species (*C. franciscorum*) is found on the California coast where it has considerable commercial importance, being gathered and dried by the Chinese. The red color exhibited by shrimps when prepared for the table is the result of a chemical change during cooking, they being naturally translucent and colored much like the sand in which they live. A very great number of crustaceans more or less closely related to the shrimps live in the sea and a few in fresh water. Consult Stebbing, 'Crustacea' (New York 1903).

SHRINE, the case in which holy relics are kept. Shrines are usually richly ornamented with gold, precious stones and elaborate carvings. The earliest form of shrines was that of the diminutive model of a Gothic church with high-pitched roof. Some shrines, as that of Saint Alban, Britain's protomartyr at Saint Albans, that of Saint Edward the Confessor at Westminster, of Saint Genevieve at Paris, were imposing architectural structures. The shrine of Saint Charles Borromeo in the Duomo of Milan is of beaten silver faced with rock-crystal.

SHROPSHIRE, a breed of sheep (q.v.).

SHROUD, a word derived from the Anglo-Saxon "scrud," a garment, and meaning more especially the winding-sheet in which it was customary to wrap the dead. This custom has been generally abandoned and the dead are buried in ordinary clothing, retaining to the last as far as possible the aspect they presented in life. The shroud has figured in many ghost stories.

SHROUDS, large ropes stretched from the heads of the lower masts to both sides of a ship, where they are fastened to the dead-eyes, which are secured to the channels, to support the masts, and named according to the masts to which they belong, the main, fore and mizzen shrouds.

SHROVETIDE, the three days between the evening of the Saturday before Quinquagesima Sunday and the morning of Ash Wednesday; so called because anciently people were wont on those days to make confession of their sins and to obtain absolution (to be *shriven*) in preparation for the season of Lent. The Tuesday of Shrovetide is called Shrove Tuesday; its evening was given up to merrymaking and to feasting on pancakes and fritters: hence the name Pancake-Tuesday or Pancake-night: in French Shrove-Tuesday is Mardi-Gras (q.v.).

SHRUBS are woody-stemmed plants of low stature. They often have several slender main stems and branch close to the ground, retaining these lateral shoots, which are lignified, and bear fruit repeatedly. The lines of difference between herbs and shrubs, and shrubs and trees, are arbitrary and difficult to define exactly. Undershrubs are those perennials which send up from underground stems annual shoots that do not become woody and die off in the autumn as do those of *Salvia pratensis*. A semi-shrub is practically the shrubby herb, whose yearly shoots become woody only at the base before the next period of vegetation and wither and die off above this. The small shrub is a low or even trailing plant like *Deutzia*

gracilis and *Epigaea repens*. When larger and much branched, the shrub is called a bush; and when so large as to resemble a tree, as the syringa often is, it becomes arborescent. Some of the shrubs are even climbing plants, like *Celastrus scandens*, the bittersweet, and certain roses. Like trees, shrubs may be deciduous or evergreen, and are often thorny. They are apt to grow in almost impenetrable thickets, with interwoven branches, and form fringes of vegetation on forest edges, in swamps, fields and moors. They are extremely useful to the horticulturist for their flowers and for their fruits, often of economic value; and to the landscape gardener, for concealing fences and buildings, and for softening the edges of trees masses.

SHUBRICK, shū'brīk, John Templar, American naval officer: b. Bull's Island, S. C., 12 Sept. 1788; lost at sea in the sloop-of-war *Epervier*, 1815. He entered the navy as midshipman in 1806, served on the *Chesapeake* in her encounter with the *Leopard* in 1807 and in 1812 was promoted lieutenant. He was assigned to the *Constitution*, participated in her engagement with the *Guerrière* in 1812 and was later on the *Hornet* during her engagement with the *Peacock* in 1813, receiving medals from Congress for his services. He was second lieutenant of the *President* when she was captured in 1815 and in the war with Algiers in that year was lieutenant of the *Guerrière*, the flagship of Commodore Decatur, with whom he was engaged in all the movements against the Barbary powers. Upon the conclusion of peace he was commissioned to bear the treaty to the United States. He sailed in command of the *Epervier* early in July 1815 and was never again heard from after passing Gibraltar.

SHUBRICK, William Brandford, American naval officer, brother of John Templar Shubrick (q.v.): b. Bull's Island, S. C., 31 Oct. 1790; d. Washington, D. C., 27 May 1874. He entered Harvard in 1805, but was appointed midshipman in 1806. He attained rank as lieutenant in 1813, was placed in command of a gunboat in Hampton Roads, was engaged in the defense of Norfolk and the navy yard at Gosport and later in that year was transferred to the *Constitution*. He participated in the capture of the *Cyane* and the *Levant* by that vessel and was voted a sword by his native State and a medal by Congress in recognition of his services. He sailed around the world in the *Washington* in 1815-18, the first United States vessel to make that cruise, was appointed commander in 1820 and served until 1826 in command of the navy yards at Charlestown, Mass., and at New York. In 1826 he was appointed to the command of the *Lexington*, was commissioned captain in 1831 and in 1838-40 was in command of the West India squadron. He had charge of the Norfolk navy yard in 1840-43, was chief of the bureau of clothing and provisions for the navy in 1845-46, in the latter year was appointed to command the Pacific squadron, captured several ports during the Mexican War and in 1852 was appointed to the Lighthouse Board. He was in command of the Atlantic Coast squadron for a time in 1853 and then resumed his duties as chairman of the Lighthouse Board, in which post he remained until his retirement with the exception of 1858-

59, when he was in command of the Brazil squadron and Paraguay expedition. He was retired in 1861, but remained on the Advisory Board until 1870; in 1862 he was commissioned rear-admiral.

SHUCKBURGH, Richard, surgeon in British army, reputed author of 'Yankee Doodle': b. about 1705; d. Schenectady, August 1773. He appeared in America in 1735. In 1737 he was commissioned surgeon to the four independent companies of foot at New York. Tradition says he wrote the original humorous stanzas of 'Yankee Doodle' to an old and familiar English jig and palmed them off as a famous march-song upon the motley New England volunteers that joined the British regulars at Fort Crailo, near Albany, N. Y., for the expedition against Canada during the French and Indian War. A Richard and Mary Shuckburgh baptized a child John at Albany, 15 March 1747. Shuckburgh became interested in the Indians about 1748 and seems to have been in friendly relations with Sir William Johnson, long-time colonial Indian commissioner and who made him secretary of Indian affairs in 1759. Dr. Shuckburgh was then residing at Schenectady and was by turns with the army and under Johnson until August 1773 when his death was announced in the *New York Gazette* as a "gentleman of very genteel family and of infinite jest and humour."

SHUFELDT, shoo'fēlt, Robert Wilson, surgeon and biologist: b. New York, 1 Dec. 1850. He studied at Cornell University, school of engineering, but withdrew in 1873 to study medicine at Columbian, now George Washington University, where he was graduated in 1876, receiving the prize for the best thesis, '6000 observations on temperature of children,' since published. He had seen service early in the Civil War; became surgeon with Generals Merritt, Crook and Sheridan in frontier Indian wars 1876-81. He was appointed curator Army Medical Museum, Washington, 1882; honorary curator Smithsonian Institution 1895; judge at the World's Fair, Chicago, 1893; honorary member Royal Australasian Ornithological Union and in 1914 elected by that society to be delegate British Association for the Advancement of Science, Melbourne. He is author of nearly 1,300 titles (10,000 illustrations) to books, memoirs, papers, articles, etc., devoted to ornithology, anatomy and physiology of the vertebrata; osteology of birds, mammals and fishes; nature study, art, travel, photography, taxidermy, medico-legal studies, medicine and surgery, reptiles, fossil animals, zoological gardens and their management, psychology, sociology, popular botany, reviews and critiques, etc., with formal works on 'The Negro'; 'Studies of the Human Form'; 'Myology of the Raven'; 'Chapters on the Natural History of the United States'; 'Osteology of Birds,' etc.

SHULL, George Harrison, American botanist: b. Clark County, Ohio, 15 April 1874. He was graduated at Antioch College in 1901 and took his Ph.D. at the University of Chicago in 1904. He was botanical expert at the United States Bureau of Plant Industry in 1902-04; assistant in plant physiology at the University of Chicago in 1903-04; botanical investigator at the stations for experimental investigation at Carnegie Institute, Washington, and at Cold

Spring Harbor in 1904-15; and has since been professor of botany and genetics at Princeton University. He is managing editor of *Genetics* and associate editor of the genetics department of *Botanical Abstracts*.

SHUMAGIN (sho'ma-gēn) **ISLANDS**, Alaska, a group of islands south of the Alaska Peninsula, 150 miles east of its tip and 950 miles southwest of Sitka. They were discovered by Bering in 1741. The island Unga is the headquarters of the Alaskan cod-fishing industry. Fox-farming is projected for several of the islands.

SHUMLA, shoom'lā, or **SCHUMNA**, Bulgaria, a town 56 miles west of Varna, surrounded by the hills of the Balkans. It is by the formation of its surroundings a natural stronghold. A series of outworks, strong redoubts, a citadel and batteries have been added to its defense. Furthermore several roads, military and otherwise, radiating from this point, lend to it additional importance. Much business is transacted around the large square. Interesting features are the mosques; a fine mausoleum (18th century) of the Grand Vizier Djazzar-Hassan-Pasha; the barracks and the baths. Shumla is the residence of a Greek archbishop. The railroad station bears the name of "Shumla Road," a legacy of the English engineers who built the line between Rustchuck and Varna. There are important manufactures of copper, silk, leather, clothing and slippers, and an extensive trade. The Russians made three unsuccessful attempts to capture the town; it capitulated, however, in 1878. Pop. 23,000.

SHUNT. See ELECTRICAL TERMS.

SHURTLEFF, Roswell Morse, American artist: b. Rindge, N. H., 14 June 1838. He was graduated at Dartmouth College in 1851; worked at lithography and drawing on wood till 1861, when he enlisted with the 99th New York Volunteers, of which he became lieutenant and adjutant. He was the first Union officer wounded and taken prisoner in the war, 19 July 1861, and was not released until after nearly eight months' imprisonment. Illustration of books and magazines absorbed his efforts for many years, but he began to paint in 1870 and has executed numerous landscapes in both water and oil, largely transcripts of scenery in the Adirondacks.

SHURTLEFF COLLEGE, located at Alton, Ill. It was founded by the Baptists and first opened to students in 1827. John M. Peck, the first Baptist Home Missionary to the West, was one of the most active agents in its founding. The organization includes a preparatory department, a collegiate department and a conservatory of music. There are three regular college courses, leading to the degrees of A.B., B.S., and Ph.D., respectively. All departments are coeducational. The buildings and grounds are valued at \$105,221; the productive funds amount to \$175,908.18 and the annual income amounts to \$26,766.26. The library contains 20,000 volumes and the enrolment shows 126 students.

SHUSHWAP, shoo'swōp (correctly *Se-quapmug*), North American Indian tribe of Salishan stock, living in British Columbia between Fraser River and the Rocky Mountain Divide, and between the Quesnelle and Thomp-

son rivers. They are the most important Salishan tribe of British Columbia, and are neighbors on the north of the Athapaskan tribe of Tsilkotin, and on the south of the Salishan tribes of Okanagan, Ntlakyapamuk and Lillooet. They occupy villages which are reservations under the Okanagan and Williams Lake agencies. They built circular, underground houses, did not follow the clan system and their women were skilled in weaving baskets and matting. Their numbers dwindled to about half after the country was opened by the miners, but are now slightly on the increase. They are for the most part civilized and Christians.

SHUSTER, William Morgan, American lawyer and financial expert: b. Washington, D. C., 23 Feb. 1877. He was educated at the Columbian (now the George Washington) University, and in 1899-1906 was in the United States Customs Service in Cuba and in the Philippines. In 1906-09 he was a member of the Philippine Commission and secretary of public instruction in the Philippine Islands. From May 1911 until January 1912 he was Treasurer-General and financial adviser to Persia. He became involved in difficulties through his determined opposition to Russian intrigue in Persia, however, and was forced to resign, the circumstances at the time attracting world-wide attention. He has been connected with the publishing house, the Century Company, since 1915. Author of 'The Strangling of Persia' (1912).

SHUSTER, shoos'tēr, or **SHÚSH TAR**, Persia, in the province of Khuzistan, on the Karun, 250 miles southwest of Ispahan. It is a walled town, defended by a castle. It is favorably situated for commerce. The houses, of stone, are built with two stories underground. Wandering tribes, which generally camp with their flocks and herds in the vicinity during the winter, add considerably to the population. The inhabitants are noted for their hospitality. The site of the ancient Susa is not far from Shuster. Pop. about 18,000.

SHUTE, Henry Augustus, American author: b. Exeter, N. H., 17 Nov. 1856. He was graduated at Harvard University in 1879, was admitted to the bar in 1882 and from 1883 was police justice at Exeter. He is known for his humorous books, chiefly delineating boy character, but written for adults. Author of 'The Real Diary of a Real Boy' (1902); 'Letters to Beany and Love Letters of Plupy Shute' (1905); 'Real Boys' (1905); 'A Profane and Somewhat Unreliable History of Exeter' (1907); 'A Country Lawyer' (1911); 'Plupy "the Real Boy"' (1911); 'The Mis-adventures of Three Good Boys' (1914); 'The Youth of Plupy' (1917); 'The Lad With the Downy Chin' (1917), etc.

SHUT-IN SOCIETY, an American organization established in order to soften the lot of invalids by supplying various desirable objects which might otherwise be unattainable. Local societies, besides supplying their sick members with fruit, flowers, reading material, medicines and nourishing foods, also undertake to supply easy chairs and other helps to convalescence.

SHUTTER, Marion Daniel, American Universalist clergyman: b. New Philadelphia, Ohio, 4 Aug. 1853. He was graduated from the

University of Wooster, Ohio, in 1876, from the Baptist Theological Seminary, Chicago, in 1881, and was ordained in the Baptist ministry. He was in charge of the Olivet Baptist Church, Minneapolis, for some years, but afterward changed his views and became pastor of the First Universalist Church there. He has published 'Wit and Humor of the Bible' (1892); 'Justice and Mercy' (1894); 'Applied Evolution' (1900); 'The Way the Preachers Pray' (1900); 'Life of James Harvey Tuttle' (1905); 'Report of the Minneapolis Vice Commission' (1910), etc.

SHUTTLE, an instrument used by weavers for shooting or passing the thread of the weft from one side of the web to the other, between the threads of the warp. It is a boat-shaped piece of wood which carries a bobbin or cop containing the yarn of the weft or woof. The shuttle sometimes has wheels to facilitate its motion.

In a sewing machine, the sliding thread-holder which carries the lower thread between the needle and the upper thread, to make a lock stitch. In hydraulic engineering, the gate which opens to allow the water to flow onto a wheel. That side of the wheel which receives the water is known as the shuttle side.

SHUTTLEWORTH, Edward Buckingham, Canadian bacteriologist and chemist: b. Sheffield, England, 1842. He was educated at Dublin and at the Royal School of Mines, and removing to Toronto, Canada, became identified with the development of the chemical industry there. In 1866 he was one of the founders of the Canadian Pharmaceutical Society which later became the College of Pharmacy, in which Shuttleworth was dean and professor of chemistry in 1882-91. He was also a member of the medical faculties of Victoria and Trinity universities, and of the Ontario Medical College for Women. He was city bacteriologist of Toronto for some years prior to his retirement in 1907.

SHYLOCK, a character in Shakespeare's 'Merchant of Venice.' He lends Antonio, a merchant of Venice, 3,000 ducats on condition that in the failure to pay in three months the forfeit shall be a pound of the merchant's flesh cut off wherever Shylock chooses. His purpose is defeated by Portia, representing a young lawyer equipped with the opinion of Bellario, a learned doctor of Padua. Up to the time of Macklin, who played Shylock in 1741, the part had been always represented by the low comedian, and was given a broadly humorous interpretation. Macklin invested it with tragic qualities and represented the Jew as a revengeful, inexorable money lender. In 1814 Edmund Keane presented the part so as to elicit sympathy for one who was ill-used by circumstances. Modern opinion concurs in that he was the victim of a quibble and that even on the point of his conspiracy against the state his conviction was of doubtful propriety.

SI-KIANG, sē-kē-āng', or **WEST RIVER**, China, the most important of the streams which unite to form the Canton River. It rises in the province of Kwang-si, and is navigable for vessels drawing 12 feet 75 miles from the sea. It is also called the Blue River, from the remarkable purity and clearness of its waters. By it are conveyed the sugarcanes that grow in the

vicinity, as well as the rafts of timber from the forests of Kwang-si to the markets of Canton.

SIA (sē'a) **INDIANS**, a Pueblo tribe of New Mexico. See **QUERES**.

SIALOGOGUE, any medicine which promotes the flow of saliva. Such medicines are either vegetable or mineral. The former embrace most of the pungent plants, particularly sorrel, tobacco, pellitory root and mezereon; the latter, several of the metals, when taken constitutionally, especially mercury. The first are called masticatories, because the effect is produced merely by chewing.

SIAM, sī-ām' or sē-ām', a country of eastern Asia, on the peninsula of Indo-China, extending between 4° and 21° N. lat. and between 97° and 106° E. long., lies between French Indo-China on the northeast and east and British Burma on the northwest, with the Gulf of Siam on the south. The greatest length of the country is over 1,000 miles from north to south, and over 500 miles from east to west; total area, about 200,000 square miles. A natural boundary is the range of mountains extending from north to south along the frontier of Lower Burma to the Malay Peninsula. There are also mountains to the north, while great fertile plains stretch toward the south, mainly drained by the Menam and its tributaries. On the 1,700 miles of coast line there are several fine harbors. The most important part of Siam lies in the valley of the Menam, the country of the true Siamese. The boundaries on the Bay of Bengal reach from Burma in a southerly line to the northern frontier of Kelantan and Kedah in the Malay Peninsula in the latitude of about 7° S. The island of Junk Salong, separated from the mainland by the Pak Phra Strait, is rich in tin ore deposits and belongs to Siam. The principal river is the Menam ("mother of waters"), which rises in the mountains and runs a course of 600 miles, being fed by the waters of the Me-ping, the Me-ing, the Me-Wang, the Me-mam-fe and numerous smaller streams. It falls into the Gulf of Siam by three channels 18 miles below Bangkok. The Meklong and the Bangpakong flow into the Gulf of Siam, while the Mekong, the greatest river of the Siam Peninsula, has a great part of its course along Siamese territory, but navigation for vessels of any size is impeded by rapids. This river is usually identified with the Lan-tsan, which rises near Chiamdo in Tibet and flows for 2,800 miles in a generally southward direction to the China Sea, which it enters by several mouths in Cochin China, a country formed by its deltaic deposits. Formerly the Lai Mountains were claimed as the eastern boundary, but in 1893 the French pressed the claims of Annam to the territory between the mountains and the river, and the Siamese were compelled to retire, since when the Mekong forms in great part the boundary between Siam and Indo-China. Other rivers are the Tachin in the west and the Salwin along the northwest boundary. The Menam annually overflows its banks in the plains and covers them with a thick layer of fertile soil, in the same way as the Nile. The plain of the Menam Valley, the adjoining eastern coast and the Korat Plateau (from 400 to 1,000 feet high)

occupy the greater part of the country. These plains are fringed by hills up to 5,000 feet high. Only the land adjoining the rivers is under cultivation; a great part of the country is covered with thick jungle. Geographically Siam falls into three well-defined regions: the mountainous region west and northwest; the great central plateau extending to the sea on the south; and Lower Siam, a narrow strip of land from 40 to 100 miles wide and forming the northern part of the Malay Peninsula.

Climate.—A tropical climate prevails in Siam. Though it varies with the latitude and elevation of its surface, there are but two seasons—the wet and the dry. The former extends from May to October, when the southwest trade wind blows; the latter from November to April, with a continuously clear sky. The annual average temperature is 82° F. The heat increases during February and March, reaching to over 100° in April, the hottest month. The coolest period is between November and January, when the thermometer often goes down to 62°. Work is suspended during the hot hours of the day. The heaviest rainfall occurs in July and August, which months also are extremely hot. For foreign visitors the climate is unhealthy owing to the many kinds of epidemics, especially malaria, which prevails in the jungle regions. The best months for visiting Siam are between November and January.

Minerals.—Gold is extensively diffused and is obtained in tolerable purity. Copper, iron, tin, precious stones, coal and nitrate deposits are found in different parts. European gold prospectors have met with little success, owing to climatic and other difficulties. The few gold mines now actually worked are owned by Chinese and are situated chiefly in the Malay Peninsula. Northern Siam formerly produced a considerable quantity of iron, but very little is now extracted; all that is used in the country is imported. The coal is of poor quality. Rubies and sapphires are found in plenty, mainly in the southeast of Chantaburi province. Siamese sapphires enjoy a world-wide reputation for excellence. The only large output of mineral is tin, the principal mines for which being those of Puket Island, Takuapa, Panga, Trang and Gherbi on the west coast of the Malay Peninsula, and of Nakon, Rahman, Sritamaraj and Jalar on the east coast. Zinc and antimony are also found east of the Menam.

Vegetation.—Rice and maize are the grains most extensively cultivated in the country. Of the tropical farinaceous roots the Siamese raise the usual varieties, and among others the sweet-potato. Cocoa and areca palms are numerous, especially the former, in the lower districts, and the oil is extensively exported. No part of the East is more celebrated for the abundance and quality of its fruits. The mango, mangosteen, litchi, durian, pomegranate, guava, pineapple, and, in short all the fruits of southeastern Asia, the Indian Islands and tropical America, are abundant and of exquisite quality. The cultivation of the sugarcane is carried on on an extensive scale. Black pepper of good quality, tobacco and cotton of several sorts are largely produced. Sappan-wood is procured extensively from the forests between lat. 10°

and 13°, and in point of quantity it forms one of the most considerable of the Siamese exports. Excellent teak-timber abounds in the forests of Upper Siam and is much used in the construction of junks and temples. There is also a large foreign demand for it as timber for shipbuilding.

Animals.—Among carnivorous animals are the tiger and leopard, the bear, otter, the musk-civet, the cat and the dog, both wild and domestic. The celebrated Laos cats, with light chocolate-colored hair and blue eyes, are a Siamese product. Porcupines, squirrels, rats and mice are common. The orang-utan and other species of apes are abundant. Among the ruminating quadrupeds are found seven species of deer, the sheep, goat, ox and buffalo. The single-horned rhinoceros is met with in unusual numbers and is hunted for its hide and horn, both of which are exported to China. The principal boast of the Siamese, however, is in the high perfection of their elephants, which here attain a size and beauty elsewhere unknown, and are held in high esteem throughout India. Ordinary elephants are employed in heavy labor, but the white (really light ashy-gray) elephant, Chang Phenak or Albino elephant, is a sacred animal and is worshipped as such by all classes of the people; in fact, that worship is now confined to Siam, having died out in India and elsewhere. The well-known Siamese red flag, with a white elephant, was abolished in 1918. Among the birds the water-birds and waders are by far the most numerous; geese, ducks, boobies, cormorants, king-fishers, storks and pelicans are frequent; the forests abound with peacocks, pheasants and pigeons, and in the islands are large flocks of the swallows that produce the famed edible birds'-nests. Crocodiles, geckoes and other kinds of lizards, tortoises and green-turtles are numerous, the last of which, as well as their eggs, are in great request among the Siamese as an article of food, and from their sale add not inconsiderably to the royal revenue. The python serpent attains an immense size and there are many species of snakes. The fish of the Menam are abundant.

Population.—The capital of Siam is Bangkok (q.v.), with a population of nearly 630,000. The first complete census of the country was taken in 1909; the latest available statistics estimate the total population at about 8,500,000, of whom about 500,000 are Chinese. Some authorities even place the number of Chinese as high as 1,000,000. Besides these and the pure Siamese the inhabitants include Laos, Burmese, Cambodians, Malaysians and Annamese, all members of the great Mongolian family. These are generally not temporary sojourners in the land, but fixed residents, in many cases the descendants of people who settled there centuries ago. They are now hardly distinguishable from the Siamese natives. There are also cross-breeds between these different races and between them and the pure Siamese stock, which is estimated at about 2,000,000 of the entire population. In stature they do not average more than five feet three inches in height; they have a lighter-colored skin than the western Asiatics, but darker than the Chinese. They are inclined to obesity, have large lower limbs and stout, long arms; yet they are by no means a strong or

robust race. Their faces are broad and flat, with round prominent cheek-bones, a small nose obtusely pointed and rather hollow at the bridge, a large mouth and rather thick lips, the lower jaw long and square at the back, small black eyes, a low forehead and very scanty beard. Their hair is always black, thick, coarse and loose, worn close by both sexes, except from the forehead to the crown, where it is about two inches long and made to stand erect. The children's heads are shaven, even just after birth, except at a small spot near the forehead, where a small tuft of hair is left. As this grows longer it is plaited and fastened with metal pins, which are jeweled among the wealthy. This tuft is shaved off on reaching the 11th year (adolescence), both in the case of boys and girls, a ceremony which forms an important event in the family history, being performed on an auspicious (astrological) day by some prominent personage in the town or village. In the royal family the king performs this tonsorial operation himself. The customary marriage age is 17 or 18 for young men and 14 to 15 for girls. Weddings are conducted with much pomp and ceremonial. Polygamy is permitted, but the first wife retains a position of pre-eminence over the others. Monogamy is the custom among the lower orders and especially among those of the upper classes who have received a European education. Disposal of the dead is by cremation, except in the cases of those who have died an unnatural death, within which category the victims of epidemics were formerly included. Immediately after death the body is externally embalmed, placed in a large jar, which is sealed up, and preserved in the house for some months before the cremation takes place in accordance with Buddhist rites. The final ceremony is carried out amid rejoicing, theatricals and fireworks to cheer the soul of the departed.

The dress both of men and women consists of the *panung*, a yard-wide piece of cloth three yards long, which is wound round the waist so that it hangs down and covers the thighs. Most of this cloth, formerly homespun, is now machine-made and imported from Great Britain and India. Silk is used instead of cotton by the wealthy and nobility; the ladies of the court have *panungs* of seven different colors, one for each day of the week. Those who can afford to wear shoes and stockings; the majority go bare-footed.

The staple foods are rice and fish, with which a small quantity of hot water or tea is taken. The food is placed in dishes on the floor; the family squat around these and eat with their fingers. Spoons, forks and knives are used by the upper classes. Foreign drinks are confined to a very limited circle; the intoxicating beverage of the people is *arak*, which is brewed from rice or sugar. Opium is less popular than in China; it was prohibited in 1838, but is now a government monopoly. Tobacco is more commonly used for chewing than smoking. Betel-nut chewing is a habit common to all women; at banquets it takes the place of dessert.

Theatres, moving-picture shows and open-air sports such as kite-flying and football are very popular among the Siamese, who also patronize cock-fighting and fish-fighting ex-

hibitions in large numbers, at which much betting is done in "backing favorites." Gambling houses and lotteries run by Chinese do a highly-profitable business and contribute large sums to the revenue. The great festival of the year is the birthday of Buddha and lasts three days. It comes about a week after New Year's Day, the latter falling on the first of April. The first day is devoted to feasting, the second to religious exercises, and the third to games, entertainments and gambling. All the different races in the country participate in this festival. The *Teu Nam* or "Water-Drinking Ceremony" is observed twice a year, when the royal family and state officials assemble in the temple, present themselves to the king and drink water from a golden jar. Early in May occurs the "Rice-Planting Ceremony," at which the Minister of Agriculture officiates and the king not infrequently attends *incognito*.

Religions.—The state religion is Buddhism, to which creed nearly all the people subscribe. Every other faith, however, is welcomed, whether Christianity, Hinduism or Islam. Land is readily granted for the erection of churches, mosques and temples. Religious persecution is not—and never has been—known in Siam. Buddhism was introduced from India between the 5th and 6th centuries A.D. in the form of the so-called Great Vehicle School—such as is now observed in China, Japan and Tibet. Since 1044, when the doctrine of the Small Vehicle School, compiled by King Parakkamabahn of Ceylon, was translated into Siamese, the people finally adopted Southern Buddhism as is also practised in Burma, Cambodia and Ceylon (see **BUDDHISM**). There are about 10,000 monasteries in Siam, with about 300,000 inmates. It is customary for every man to spend some time under monastic discipline, whether in youth, middle or old age. Some stay for a few months, some for several years and others for life. The inmates are graded according to attainments in scholarships. The two great branches of Christianity number many converts. The Roman Catholic mission began its labors in 1660 and has now about 50 churches in the country. The American Presbyterians also maintain an active mission.

Language.—The Siamese language is based on the Sanskrit, Chinese, Cambodian, Laos and Malay languages. Most of the words are monosyllable and are pronounced, as in Chinese, with different intonations or inflexions of the voice. There are five of these vocal accents, which are indicated by signs. Thus the same word, when pronounced in five different tones, has five different meanings, e.g., the word written *song* means, according to inflexion, "envelope," "to shine," "to hide," "noisy" and "two." Abstract nouns are largely represented by Sanskrit words.

Government.—Siam is the only independent country on the Indo-China Peninsula; it is an absolute monarchy without a constitution. The king rules with the aid of a Cabinet (*Senabodi*) made up of nine Ministers, Foreign, Interior, War, Navy, Local Government, Justice, Finance, Education and Agriculture. Most of these offices are held by members of the royal family. Together with other members the council numbers about 40 officials. They are assisted by British and other foreign advisers.

For administrative purposes the country is divided into the metropolitan district of Bangkok (Krung Teb) and 17 *monton* or provinces: (1) Krung Kao, (2) Chantaburi, (3) Surat or Chumporn, (4) Nakorn Chaisri, (5) Nakorn Rajasima or Korat, (6) Nakorn Sawan, (7) Nakorn Sritamara, (8) Patani, (9) Prachinburi, (10) Pitsanulok, (11) Payab, (12) Petchaburi, (13) Puket, (14) Rajaburi, (15) Roi Et, (16) Ubon Rajatani, (17) Udorn. A high commissioner governs each of the provinces and the district by royal authority. Each commissioner has several subordinate *muang* governors under him, while tributary districts are ruled by their own chiefs. The financial adviser to the government is usually a British officer.

Justice.—The judicial system consists of a primary or Muang Court and a higher Monton Court in each province; the Court of Appeal and the Dika (Supreme) Court sit in Bangkok, where there is also a Court of Foreign Causes, to decide disputes between foreigners and between them and the natives.

Education.—From early ages a system of elementary education has been conducted in the monasteries by the Buddhist monks. A modern system has been introduced in recent years, which is operative as yet only in the capital, whence a number of students are sent abroad every year. Steps were taken in 1917 to establish a university at Bangkok.

Defense.—Conscription on the European model obtains, but with numerous legal exemptions, while the uncivilized tribes are not called on to serve. The army consists of 10 divisions, each of two infantry and one cavalry regiments, two four-gun batteries and an engineer battalion. The peace strength is about 12,000 men. The navy is composed of 25 ships, mainly small gunboats of little fighting value. About 5,000 men are available for service, while some 20,000 are in the reserve. Most of the vessels are Japanese-built.

Communications.—There are state and private railroads in Siam, with a mileage of about 1,300. The former are the North Siam Lines, from Bangkok to Korat; the Eastern Line from Bangkok to Petriu; the River Line, within Bangkok; the Sawankaloke Line, Northern Line and South Siam lines. The private lines are the Paknam Light Railway, Meklong Railway and the Prabat Line, which was built and is owned by a Siamese. There is little traffic and trains run only in the daytime.

Shipping.—The Siam Navigation Company run two coastwise lines from Bangkok. As most of the towns are on the river, there is a heavy river and canal traffic carried on in native boats. Many foreign vessels enter the port of Bangkok every year, while a Siamese company maintains a regular service between the capital and Hongkong and the southern China ports since 1909.

Commerce and Industries.—Most of the internal trade of Siam is in the hands of Chinese. Foreigners (Europeans) control practically the whole foreign trade. Agriculture is the principal industry, and rice the chief product, which is exported in large quantities. For other products, see sections, *Minerals*; *Vegetation*. The Siamese have made but little progress in the useful arts. House-carpentry, canoe and junk-building, manufacturing pottery and coarse

cutlery, leather-dressing and the construction of musical instruments are their chief mechanical employments. A few rude hand-loom are in operation, chiefly worked by women, but the fabrics, whether of silk or cotton, are of coarse quality. Their domestic architecture is in an equally rude and backward state—the houses of the lower orders being formed wholly of wood or bamboo, roofed with palm-leaves and mostly raised on piles, as in the rest of ultra-Gangetic India. Not many houses in the capital are built with brick and mortar. Many of their houses, too, are constructed on boats, which abound on the river near Bangkok.

History.—Siam appears to have no place in history prior to 638 A.D., and the credible records go back only to 1350, the date of the foundation of Ayuthia, the old capital, on the Menam, about 60 miles above its mouth. In 1612 an English ship ascended this river as far as Ayuthia, eight years after which the Portuguese sent thither their first missionaries. In 1689 Constantine Phaulcon, an enterprising Greek, became Prime Minister, and introduced a respect for European customs and notions. Mutual embassies were at this period sent between Siam and the court of France, with which Phaulcon intrigued to bring about a revolution. This led to his downfall and death, as well as the expulsion of the French. Contests for the throne distracted the country from 1690 till 1759; during which interval Alompra, the victorious ruler of Burma, overran the whole valley of the Menam. The country was afterward wrested from the Burmese by Pyeya-tak or Phyatak, who was of Chinese extraction, at the head of a number of natives. He planted himself on the throne and with a view to commerce made Bangkok the metropolis, instead of Ayuthia. Being a cruel ruler he was murdered by his general, Chakri, who himself seized the throne in 1782 and was the founder of the present reigning dynasty. Maha Mong-Kut, who ascended the throne in 1851 and died in 1868, was a man of science and energy. He was succeeded by King Chulalongkorn I, who died 23 Oct. 1910. The present king is Chowfa Maha Vajiravudh (b. 1881). Siam declared war on Germany and Austria on 22 July 1917 and seized all German vessels lying in Siamese harbors. All Germans and Austrians were arrested and their businesses closed.

HENRI F. KLEIN,
Editorial Staff of the Americana.

SIAM, Gulf of, East India, a large arm of the China Sea, bounded by the Malay Peninsula on the west, and by Siam and French Indo-China on the east. It is about 400 miles long and 250 miles wide, but very shallow, being nowhere more than 300 feet in depth. The large delta of the Mekong is steadily encroaching on its waters.

SIAMANG. See GIBBON.

SIAMESE (si-a-mēs' or mēz') **TWINS:** b. Bangesau, Siam, 15 April 1811; d. Mount Airy, N. C., 17 Jan. 1874. The name given to two individuals of Chinese extraction, named Chang and Eng, who from the manner of their physiological connection were regarded as examples of "anterior duplicity." They grew to be about five feet two inches in height, could walk, run and swim. In April 1829 they were brought to America and exhibited throughout the United States and later in Europe. They finally settled at Mount Airy and lived there until their death.

SIAN-FU, provincial capital of Shensi, N. W. China, often erroneously called Si-ngan-fu, Sin-gan-fu, Hsian-fu; formerly called Chang-an. Once the important capital of the Tang Dynasty. The city became famous through the discovery in 1625 near the western suburban gate of the "Nestorian Monument," dated 781, a two-ton limestone stela, 10 feet high, with an inscription of more than 2,000 characters in Chinese and Syriac (Estrangelo). The inscription tells of the arrival in 635 of Nestorian missionaries from Syria, who were well received by Emperor Taitsung. In 1907 the Danish explorer, Fritz von Holm, set out to try and procure the Tablet for science, but the mandarins at Sian-fu caused the stone to be removed into the Peilin or "Stone Coppice" inside the city walls where it would be safe and under roof. The Holm expedition thus preserved the stela for all ages, but it furthermore obtained a perfect limestone replica of the monument, 10 feet high and weighing two tons, which was brought to New York, where it was placed as a loan in the Metropolitan Museum of Art. "Chingchiaopi" is the Chinese name of the Tablet. Sian-fu was again the capital of China for nine months, in 1900-01, when the late emperor and empress-dowager fled thither from Peking during the Boxer troubles. The population is about 1,000,000.

SIARGAO, sē-ār-gā'ō, an island of the Philippines, 20 miles from the northeast coast of Mindanao; length, 20 miles, north and south; width, 14 miles; area, 176 square miles. It is traversed from north to south by a mountain range, the highest peaks of which are in the south. The northern, southern and western coasts are paralleled by a reef lying three miles off shore; the ports on the coast are reached by natural channels through this reef. The island has seven towns, several hamlets and a considerable rural population.

SIBALÓN, sē-bā-lôn', Philippines, pueblo, province of Antique, island of Panay, on the Sibalon River, six miles from its mouth, 10 miles northeast of San José de Buenavista. Pop. 11,680.

SIBBALD'S or BLUE WHALE. See WHALE.

SIBELIUS, sē-bā'li-ūs, Jean, Finnish composer: b. Tavastehus in the government of the same name, 8 Dec. 1865. He studied under Wegelius at Helsingfors, Becker at Berlin, and Goldmark and Fuchs at Vienna. Since 1893 he has been professor at the Institute of Helsingfors. His work as a composer has placed him at the head of living Finnish masters and he is regarded as a worthy successor of the greatest names in the history of Finnish music. He is regarded as the founder of Finnish national music and his work is singularly free from the influence of foreign composers. His compositions are strong, passionate, mystic and at times even weird and not easy of comprehension to those unacquainted with Finnish character and history. He is thoroughly imbued with the music of the native folk songs, and while he never definitely follows themes of the folk music he rarely strays away from its influence. Particularly is this noticeable in his use of five-four rhythm and of the repetition of single notes, both characteristic of the native music.

on the south by an irregular frontier line of over 6,000 miles separating it from Persia, Afghanistan and the Chinese territories. Siberia stretches from Orsk for over 4,200 miles northeastward to Cape Vostochni on Bering Strait, and from Cape Severo (Chelyuskin) for about 2,000 miles southward to the Tarbagatai range, with a total area estimated at 4,831,882 square miles, and a population of close on 11,000,000. In superficial area—according to these figures—Siberia has 1,214,209 square miles more than the United States and 1,031,882 square miles more than Europe. Since the extension of the Russian dominions in central Asia a territorial division called Central Asia has been formed partly taken from what was formerly Siberia, partly formed of newly-acquired territory, and comprising the geographical regions subdivided into provinces, of northern Caucasia and Trans-Caucasia, forming the Caucasus; area, 181,173 square miles, with a population of nearly 13,000,000; the four provinces of the Steppes, with an area of 710,905 square miles and a population of nearly 4,000,000; and the four provinces of Turkestan, area, 420,807 square miles, population, 6,613,600, and, finally, the Trans-Caspian provinces, area, 235,120 square miles, population, 535,000. Some authorities give the area of Trans-Caspia as 214,237 square miles. The total area of Asiatic Russia is approximately 6,294,120 square miles,

according to its productive powers, in four divisions—the steppe or pastoral, the agricultural, the woody, and the moorland or tundra. The steppe, occupying the most elevated part of the plain, extends from the southern frontiers north to lat. 55° ; and from the western frontiers, within these limits, east to the banks of the Irtish. The greater part of it consists of what is called the Steppe of Ishim, and has a bare and almost sterile surface, often incrustated with salt, but also occasionally covered with a scanty vegetation. The agricultural division extends northward to about lat. 60° . In many parts, where it borders on the steppe, it has much of the same character, and has only occasional tracts which have been or can be advantageously brought under the plow; and in many other parts primeval forests are often found. The division thus named under favorable circumstances might furnish subsistence to a very large population; but as yet it is only the more fertile alluvial tracts adjacent to the rivers that have been brought under anything like regular culture. Within this division, though not properly belonging to it, is the Steppe of Baraba, situated between the Irtish and the Obi. It has a more abundant vegetation than the Steppe of Ishim, which it otherwise resembles, and in its northern portion is covered with nearly continuous forests of birch and fir, haunted by numerous wild animals, includ-

coasts and mouths of the rivers are frequented by immense shoals of fish and flocks of fowl.

Siberia to the east of long. 105°, forming nearly one-half of the whole territory, has a much more diversified surface than the western region, and owing partly to its general ruggedness and elevation, and partly to the greater severity of its climate, has much less land adapted for agricultural purposes. The Sea of Okhotsk has a bold and rocky shore, and the country behind rises with a steep ascent till a mountain-range is formed, with a general altitude of nearly 3,000 feet above sea-level. This range, under the name of the Stanovoi Mountains, runs nearly parallel with the coast till it reaches the frontiers of China, where it takes the name of the Jablonnoi Mountains, and proceeding west continues for a long distance to form the boundary between the two empires. It then takes the name of the Mountains of Daouria, and throws out numerous ramifications, which, continuing west, throw their arms round Lake Baikal, and cover almost all the south part of the government of Irkutsk. Other ramifications, proceeding north, form the watersheds of the numerous affluents of the right bank of the Lena. On both sides of this river the surface continues elevated, and forms a table-land, the interior of which is still very imperfectly known. The best portions of eastern Siberia occur in the south of the government of Irkutsk, where, in the lower and more open valleys in the vicinity of Lake Baikal, cultivation has been attempted with success, and the oak and hazel, unknown in other parts of Siberia, are found growing freely. In almost the whole of the same government, where the configuration of the surface does not present invincible obstacles, all the grains of Europe are grown, and even the mountains and hills are covered during the greater part of the year with good pasture. Still farther north, in the government of Yakutsk, as far as the town of same name, corn is cultivated in patches in the upper vale of the Lena, though the far greater part of it is covered with fir and pine. The north part of eastern Siberia consists of two distinct portions, the one extending from long. 105° E. to the lower valley of the Lena, and the other from that valley east to Bering Sea. The former portion is imperfectly known: the latter, as far as the Kolyma, is traversed from north to south by chains of low hills, separated from each other by wide valleys or open plains, and generally overgrown with stunted larch and birch. In these valleys and plains are numerous lakes, generally well supplied with fish, and bordered by low banks, on which a rich grassy sward is often seen. To the east of the Kolyma branches from the Stanovoi Mountains stretch north, and form a series of ranges which frequently rise from 2,000 feet to 3,000 feet. Some of these penetrate to the north coast, and are seen forming precipitous cliffs at Shelagskoi Nos, Cape North, and other headlands. Other ramifications from the Stanovoi pursue an opposite course, and traverse the remarkable peninsular of Kamchatka almost centrally to its southern extremity.

Hydrography.—The rivers are numerous and of great magnitude. From the configuration of the country they almost all flow in a northerly direction, and belong to the basin of

the Arctic Ocean. The chief exceptions are the Anadir and the affluents of the Amur in the east, and the Sir Daria, Amu Daria and other streams in the southwest. The great rivers belonging to the basin of the Arctic Ocean flow for the most part through immense tracts of level country, and hence are remarkable at once for the length of their course, the volume of water which they accumulate from numerous and important affluents, and the few obstacles which they present to a continuous navigation, but these advantages are diminished by the long period during which they are frozen over; though even then they do not cease to be available for traffic, and become, in fact, the great highways of the country. The Obi is one of the largest rivers of the Old World; the length of its course is 2,400 miles, and the area of its basin is 1,224,435 square miles. Among its important affluents, many of them so large as to be entitled to rank as magnificent rivers, are the Irtish, Ishim and Tobol, which, by uniting their streams, more than double its volume; the Tom, Tchulin and Ket. The estuary of the Obi forms a gulf from 70 miles to 80 miles wide, and about 400 miles long. Large quantities of fish are taken in this river and its tributaries. The Yenisei, the second river in importance, draws its waters from an area of not less than 1,020,000 square miles. It rises in Northern Mongolia and flows north a distance of over 2,000 miles to the Arctic Ocean. Its most important affluents are the Selenga, which, before entering Lake Baikal, drains an area of more than 140,000 square miles; the Angara, which receives the discharge of the lake, and in the lower part of its course takes the name of Upper Tunguska; the Middle Tunguska, and the Lower Tunguska. The estuary of the Yenisei is about 20 miles wide, and 200 miles long. The Lena has a course of about 2,000 miles, and drains an area of about 800,000 square miles. It rises hardly 20 miles to the west of Lake Baikal, and becomes navigable at 50 miles from its source. Its principal affluents are the Vitim, which has a course of 700 miles, of which a considerable part is navigable; the Olekma, which flows 500 miles through interminable forests; the Aldan, which drains an extensive tract of table-land between long. 125° and 140° E.; and the Viliui, which rises in a mountainous district not far from the Lower Tunguska, and flows west for about 600 miles. The most important of the minor rivers which send their waters directly to the Arctic Ocean are the Olenek, between the Yenisei and Lena; and to the east of the latter, the Indighirka and Kolyma. The only important lakes are those of Baikal, 400 miles long and in places 50 miles wide; the Sea of Aral, and Balkash-Nor or Tenghiz, in the southwest. Numerous other lakes are scattered over the surface, and more especially in the tundras, where whole chains of them, covering extensive tracts, not infrequently occur.

Geology and Minerals.—Granite and crystal-line schists are found chiefly on the eastern slopes of the Ural Mountains, in the south among the mountain-ranges of the Altaï as far north as lat. 57° N., and between long. 85° and 120° E., chiefly in the governments of Tomsk and Irkutsk, on both sides of the Upper Tunguska and east of the Yenisei; in the upper part

of the basin of the Middle Tunguska; and in the very eastern extremity of the country, from long. 165° to the shores of Bering Strait. The volcanic rocks belong mostly to the Tertiary period, and are found chiefly in the south, in connection with the granite and crystalline schists above described. They compose the great mass of the mountain-range which skirts the western shores of Lake Baikal, and are seen in a still more magnificent and interesting form in the mountains which proceed from north to south, nearly through the centre of the Peninsula of Kamchatka, where are several active volcanoes. Palæozoic rocks, including the rocks belonging partly to the Silurian, partly to the Devonian, and partly to the Carboniferous systems, are developed chiefly in the south, where they occupy a large space in the form of a triangle, the apex of which is at the town of Irkutsk, and the base on the parallel of 60°, between long. 85° and 120° E. Another large development of the same rocks is seen on the northwest and north of the Sea of Okhotsk, and to a considerable distance inland. Secondary rocks higher in the series than the Carboniferous system commence near the northern shores of Lake Tenghiz, and stretch northward, occupying a considerable tract on both sides of the upper valley of the Irtysh; a more partial development of the same rocks is seen on the north of the Obi, commencing near the confluence of the Ket, and extending north in a comparatively narrow belt to the sources of the Taz. The most extensive formation in Siberia is the Tertiary, which stretches almost continuously from the last slopes of the Ural Mountains east across the Obi to the valley of the Yenisei; and in other quarters, though more intermingled with earlier formations, covers no inconsiderable portion of the whole surface. The shores of the Arctic Ocean, almost throughout their whole extent, and to a considerable distance inland, have a deep alluvial covering, remarkable for containing deposits of fossil elephants and other animals in such quantities that the ivory obtained from them forms an important article of commerce. The minerals of Siberia are evidently of immense value, and though the real extent of surface on which they are found is as yet only roughly guessed at, there cannot be a doubt that the most precious of all the metals exists there in greater abundance than in any other part of the Old World. Till recently the auriferous deposits were supposed to be almost confined to the eastern slopes of the Ural Mountains, and to occupy a zone extending over from 5° to 6° of latitude to the north and south of Ekaterinburg; but it has been discovered that some of the eastern regions, particularly in the governments of Tomsk and Yeniseisk, are highly auriferous, and that a tract larger in area than the whole of France contains gold, not in its alluvia, but in the very matrix of its rocks of palæozoic schists and limestones, which, when pounded and analyzed, are found to be more or less impregnated with gold. The principal mining districts are those of the Ural already mentioned, the Altai and Nertchinsk, in the basin of the Amur. Besides gold, iron, copper, silver, platinum, lead, tin and zinc are found in greater or less abundance. The other notable minerals of Siberia are the emerald and topaz, of which there are celebrated mines at

Nertchinsk; salt, found in natural crystals on the banks of lakes, chiefly in the steppes of Ishim and Baraba; jasper and porphyry of great beauty, quarried especially in the valley of the Charysh among the Altai Mountains; lapis-lazuli, found among the mountains in the vicinity of Lake Baikal; diamonds, found occasionally on the eastern slopes of the Ural Mountains; malachite, obtained in greater or less quantity from all the mining districts, containing copper; and mica, in the form of large plates, extensively used as a substitute for glass, and found in greatest abundance on the banks of the Vitim.

Climate.—This country is remarkable for its rigor. The isothermal line which skirts the southern coast of Iceland, in proceeding east, descends rapidly till it reaches Petrograd, and then more gradually till it reaches long. 100° E., where it is found in lat. 52°. From this it proceeds nearly due east, passing through the southern part of Lake Baikal, the town of Nertchinsk, and the southern extremity of Kamchatka. It thus appears that the southern coast of Iceland, in lat. 63°, has the same mean temperature as eastern Siberia in lat. 52°; in other words, that in proceeding from west to east the cold increases so much as to make places in the same latitude as Berlin to have a climate nearly as cold as Iceland. In the same manner the line of permanent ground-frost descends in parts of Siberia as far south as lat. 56°, nearly the same as that of Edinburgh; and over the whole country to the east of the Ural Mountains is as low as lat. 60°. Erman found that annually between 17 December and 18 February, and most frequently in the first three weeks of January, cold is experienced exceeding 90° F. below the freezing-point; and that for two entire months, or one-sixth part of the whole year, mercury is a solid body. This extreme winter is succeeded by an exceedingly warm summer. Thaw usually commences on the 1st of April, and the temperature increases rapidly till it attains its maximum in July. In this month the average height of the thermometer is about 66° F., but it not unfrequently rises in the shade above 77°. In Yakutsk, where the cold is severest, notwithstanding its long and extreme winter, there are 128 days in the year without frost; and within that period several kinds of grain, not excluding wheat, have time to attain maturity; and in rich alluvial soils often produce a return of fifteen-fold.

Manufactures and Commerce.—The manufactures are limited, and are confined for the most part to a few of the larger towns, where government factories have been established. The more important articles are leather, earthenware, porcelain, glass and hardware. In some places, as at Telma, large woolen and linen factories employ a considerable number of hands, chiefly exiles, in weaving woolen and linen cloth, and in conducting all the previous processes of preparing the wool, flax, etc. The trade is of considerable extent; and in so far as confined to the produce of the country consists chiefly of cattle, fish, caviar, furs, skins and metals. A very important transit trade is also carried on across the country between Russia in Europe and China. From the latter part by far the most important article is tea, both in the dried leaf and in the form of cakes

or bricks. The greater part of the latter is disposed of to the nomadic tribes, and a very large proportion of the former never passes beyond the limits of Siberia, but is retained for home consumption. Other articles of importance from China are coarse cotton stuffs, rhubarb, silks, satins, etc. The chief mart for this trade is the town of Kiachta, and extensive fairs are held at various places. For the interior traffic the rivers naturally furnish the most important conveyance; but when these become closed with ice other means of conveyance must be resorted to, among which the most characteristic is that of sledges drawn by reindeer or dogs. Great impetus has been given to commerce and colonization generally throughout the region, by the completion of the railway, the longest in the world, connecting the far Orient with Europe. (See TRANS-SIBERIAN RAILWAY). The length of railways throughout Asiatic Russia in 1913 was 10,586 miles. A trade by sea has also been opened up between Europe and the rivers Obi and Yenisei.

Ethnology.—The races and tribes scattered over the different parts of Siberia are so numerous that little more can be done here than to give the names of the more important. The earliest inhabitants were probably the Yeniseians, who were followed by the Ugro-Samoyedes; these in their turn were driven out by Turkish tribes, who were ousted by the Mongols in the 13th century. To-day at least two-thirds of the whole population is Russian, and consists either of voluntary emigrants, who have found it to their interest to settle in the country, or of exiles and their descendants. In regard to the exiles Siberia is merely a penal settlement, and hence that portion of the population which, as coming from Europe, ought to be the most civilized, is not likely to be the most exemplary. A more unsophisticated, and far more interesting, population is furnished by the indigenous tribes. Beginning at the Ural Mountains and proceeding eastward we find the Samoyedes in the northwest. Immediately south of these the Ostiaks occupy both sides of the Obi, up to the confluence of the Irtysh, the northern part of the steppe of Baraba, and the whole of the woody region eastward to the banks of the Yenisei. They live by fishing and hunting, and though their physical structure is by no means robust they display both great dexterity and courage in attacking the larger and fiercer animals, both of the land and water. Some of them have embraced Christianity, but the great majority continue addicted to Shamanism. In the south, among the Altai Mountains, the Kalmucks predominate, but have laid aside a number of the usual peculiarities of their race. They subsist chiefly on the produce of their horses, cattle and sheep, and cultivate a little grain and tobacco. They have some skill in mechanical arts, particularly in the working of iron, and make their own gunpowder. Though not Buddhists they are generally addicted to other forms of superstition. Among the eastern slopes of the Altai are several Turkish tribes. The Buriats dwell chiefly on both sides of Lake Baikal, and eastward as far as the Onon. They are of Mongol origin, and closely allied to the natives of the northern provinces of China both in language and customs. The Tunguzes or Toongooses are the most widely dispersed of all the native

tribes, being found throughout many parts of Siberia from the Arctic shores to the frontiers of China. They are considered the best-formed of the native Siberians, are very expert horsemen, and live chiefly by hunting. The Yakuts live intermingled with the Tunguzes, and confine themselves almost entirely to the rearing of horses and cattle, and the preparation of dairy produce from them. They are of Tartar origin, and not a few of them are nominal converts to Christianity, though the majority, like the Tunguzes, still adhere to Shamanism. The Tchuktches occupy the northeastern portion of Siberia, and their language proves them to have a common origin with the Eskimos. Some of them spend their time in hunting and fishing, while others are nomadic in their habits. Interesting and valuable information on these tribes was collected by the Morris K. Jesup Expedition which returned to the United States in 1904.

History.—Siberia appears to have been partly conquered by Genghis-Khan and his successors, but did not become known to Europe till 1580, when a Cossack called Yermak Timofeyew, who had long robbed the vessels which navigated the Volga, finding himself hotly pressed by the Tsar of Moscow, crossed over into Asia with his accomplices. Their number sufficed to form a small army, and their courage soon enabled them to acquire extensive settlements. These Yermak offered to the tsar on the condition of obtaining pardon. The offer was accepted, and thus Russia for the first time obtained a footing in Asia. The territories thus conquered belonged to the Tartar prince Kutshum-Khan, and included his residence, which, called by the natives Isker, and by the Cossacks Sibir, has given name to the whole country. The conquests of Yermak were gradually extended, till the whole country west of the Obi was subjected to the tsar. In 1604 the town of Tomsk was founded, and became a centre from which new expeditions were fitted out and new conquests made. Private adventurers, instigated chiefly by the hope of plunder, proceeded in all directions to the south, where, not without serious reverses, they succeeded in expelling the Kirghiz; and to the east, where they entered the basin of the Lena, subdued the Yakuts, and finally, after passing the Aldan Mountains, reached the Sea of Okhotsk. In the neighborhood of Lake Baikal a formidable resistance was made by the Buriats, but their subjugation was finally completed in 1658. The town of Nertchinsk, which has since become so celebrated for its mines, was then founded, and, two years after, that of Irkutsk. A further extension of conquests to the south brought the adventurers into collision with the Chinese, and both governments taking part in the quarrel, a war, threatening the existence of one or other of the empires, became imminent. It was, however, prevented, partly by the intervention of the Jesuits resident at Peking, and a treaty in 1689 definitely fixed the boundaries of the two empires. A second treaty in 1727, confirming the former, regulated the commercial intercourse and confined it to the two localities of Kiachta and Maimachen. Never has so large a territory been acquired at so little expense. Russia, almost without any expenditure of her own means, and chiefly by the aid of a few Cossack adventurers, in little more than a cen-

tury more than doubled her area. The greater part of it indeed is a frozen inhospitable region, which must always remain comparatively worthless; but vast tracts possess a climate and soil well adapted for agriculture, and seem destined to become the abodes of a dense population engaged in agriculture, mines and fisheries.

With the building of the Trans-Siberian Railway (1891-99) emigration from Russia to Siberia became easier and was patronized by the government. Whereas in former times the annual influx of new settlers was from 20,000 to 30,000, with the opening of the railway it rose at once to from 150,000 to 200,000. During the Russo-Japanese War it was interrupted, but many Russian peasants who had been called up for military service then first made acquaintance with Siberia. No sooner was the war over than the wave of emigration rose to an unprecedented height. In 1907 the number amounted to 576,979; in 1908 there were 758,812; in 1909 there were 707,463. Since then emigration has again declined, maintaining an average of 300,000 per year. The advent of labor and money, and the establishment of new farms has transformed all the old conditions of the country. Even the nomad Kirghiz have been aroused from their lethargy by the gradual narrowing of pastures and have taken to plows and reaping-machines. New towns have arisen in Siberia, new industries have started; the Zemstov system was introduced in 1905, while a uniform system of public justice—in place of the existing arbitrary administration of autocratic officials—was instituted in 1897 by order of the ex-Tsar Nicholas. Trial by jury was not conceded but the justices were appointed by the Crown. The higher tribunals consist of eight circuit courts in the towns of Tomsk, Tobolsk, Chita, Krasnoyarsk, Irkutsk, Yakutsk, Blagovestchensk and Vladivostok, with a court of appeal above these stationed at the capital, Irkutsk (pop. 109,000). A sea route through the Kara Sea to Siberia has in recent years been opened up, chiefly by British enterprise.

Siberia has an unenviable record owing to its famous convict settlements. It was in 1710 that Peter the Great first began exiling inconvenient political opponents to the bleak steppes beyond the Urals but it was not till the first quarter of the 19th century that it became a common practice to deport criminals to Siberia in addition to political offenders. In later years a stream of emigration was directed thither and encouraged. While those prisoners who were regarded as dangerous were chained and forced to work in lead mines, those accused of minor offenses (who were frequently accompanied by their families and friends) were permitted to live in comparative freedom, running stores and workshops on their own account. Some European visitors have even brought back stories of female political exiles who had their own pianos and read the latest French novels. The squalid horrors of the convict system are described in numerous travel books and especially in Russian fiction.

The tangled skein of events that developed in Siberia between the period of the Russian Revolution in March 1917 and the summer of 1919 presents a confusing panorama, of which it is only possible as yet to give a more or less

approximate description. In a sense the Siberian imbroglio of 1918-19 was not so much a part of the Great War as a side issue that arose from it and from the Revolution. It may better be described as a civil war accompanied by half-hearted experiments in foreign intervention. Beginning as a struggle in favor of the Allies after the military collapse of Russia, it developed into a far-flung campaign against Bolshevik rule. In the early stages of the European War whole regiments of conscript Slavs—Czechs, Slovaks, Croats and Poles—in the Austro-Hungarian army deserted over to the Russian side. Though living under foreign dominion for centuries, these races had clung tenaciously to their national culture and languages. Their sympathies in the war lay with their Slavic kinsmen in Russia as against the Central Powers. Out of these deserters a Czecho-Slovak division had been formed after the Revolution and incorporated with the Russian army. It played a gallant part in the last offensive that Brussilov was able to direct against Austria before Bolshevism succeeded in demoralizing the Russian troops and navy. The Czecho-Slovaks, however, insisted on continuing the war, and demanded to be sent to France to join the Allies. The Bolshevik rulers were willing that they should leave Russia, and in February 1918 they were granted a passage to Vladivostok; but before their removal could be effected Trotzky had concluded the Brest-Litovsk Treaty with Germany (3 March 1918) and the bulk of the Czecho-Slovaks, some 50,000 at that time in the Ukraine, found themselves in danger of falling into German hands. Refusing to make peace and unable to face the German advance, they decided (after rejecting Austrian overtures to return home and be forgiven), to retreat over the railroad to Moscow and make their way thence across Siberia, across the Pacific Ocean and America to France. Hunted by the Germans, they fought a four days' battle at Bakhmach, 125 miles northeast of Kiev, defeating them severely. Under tremendous difficulties they continued their amazing journey eastward; they cut their way through and, to prove their loyalty to the government then in being, surrendered most of their equipment to the Bolsheviks, leaving also hundreds of automobiles and air planes to the Germans. Though betrayed time and again by Bolshevik treachery, their wounded murdered, attacked daily by Red Guards and Austro-German prisoners led by German agents, they at first steadfastly refused to fight against Russians and to interfere in Russian politics. After 56 days' of toil and hardships, the vanguard of this modern "Ten Thousand" completed its "Anabasis" and reached the Pacific—one of the greatest military achievements in history. Other detachments of Czecho-Slovaks remained in western Siberia and on the road to Archangel.

On 14 March 1918, Mr. A. J. Balfour pleaded in the House of Commons for Allied assistance in Siberia against the growing menace of German penetration owing to the presence of some 94,000 Austro-German prisoners of war east of Lake Baikal, and 60,000 to the west of the lake. He strongly defended the loyalty of Japan to her allies and suggested that that country should be invited to intervene "as

friends of Russia and enemies of Germany, to preserve the country from German domination." The Japanese Foreign Minister, Baron Goto, stated on 1 May that "Japan must give encouragement, assistance and support to the work of reorganization" in Russia and "preserve peace in the Far East." Negotiations were progressing between the Allied Powers on the thorny problem of intervention in Siberia.

To return to the Czecho-Slovaks. The Bolsheviks had promised them a "safe conduct" and transportation, neither of which materialized. Acting under German pressure, Trotsky ordered them to be disarmed. This was forcibly attempted in May, when the Czechs resisted and attacked the Bolshevik troops both in Europe and in Siberia, captured several towns on the Volga during June, occupied Samara and advanced to Ufa in the Ural region. They seized control of the principal grain routes, thereby cutting off the food supply from Siberia. Scattering the Bolsheviks before them, they fought their way along the Siberian Railway, and by July were in possession of the line from Chelyabinsk in the Urals to Krasnoyarsk, a distance of over 1,300 miles. Meanwhile, a large contingent of Czecho-Slovaks had arrived in Vladivostok, the eastern terminus, from which point they began operating westward to effect a junction with their comrades. The Bolsheviks were driven out of Vladivostok and Irkutsk by the end of June. The Czechs entered the Amur region and occupied several towns, and by the middle of July nearly the whole Trans-Siberian Railway was in their hands. In each of the towns at which they arrived they found a Soviet local government of Workmen's and Soldiers' Delegates, in other words, Bolshevik rule. Each of these was immediately overthrown, at which task the Moderate Russians or anti-Bolsheviks heartily assisted.

After the Bolsheviks had dispersed (in November 1917) the Constituent Assembly in Moscow, many of the members made their way into Siberia, where they secretly maintained their organization under the Red rule. The coming of the Czechs gave this group their chance. Its members established the Temporary Siberian government at Omsk on the ruins of Bolshevism in central Siberia in June and began to organize a Russian anti-Bolshevik army. Other governments sprang into existence later on: General Horvath, director of the Chinese-Eastern Railway, established a provisional government at Harbin; General Semenov founded one in Chita, and Avksentiev created the Ufa Convention, while yet another Siberian government arose at Novo-Nikolayevsk in western Siberia. A branch of the Omsk government was set up in Vladivostok. Before long trouble arose between this multitude of "independent governments," each claiming either "All Russia" or "All Siberia" as within its jurisdiction. Allied influence was exerted to settle the local rivalries. By arrangement the Ufa Convention was dissolved and merged in the Omsk government, under a directorate of five members: Avksentiev, Vinogradov and Vologodsky (Socialists), Astrov (Cadet), and General Boldereff (non-party), as commander-in-chief. Admiral Kolchak was appointed Minister for War and Marine; 10 other ministerial posts were created,

for Foreign Affairs, Interior, Finance, Justice, Communications, Munitions, Labor, Commerce, Supplies and Education. Political intrigue soon made its appearance among the central committee which threatened to lead to confusion and disintegration when the council of ministers decided to take the authority of the Directorate into its own hands. Soon after his appointment Admiral Kolchak proceeded to the front on a tour of inspection. Just at that time the Czech commander had invited the British 25th Middlesex Battalion to attend the presentation of colors to the Czech regiments at Ekaterinburg in the Urals, and Col. John Ward, an English Labor member of Parliament, had accepted for the band and 100 men of his battalion. Railway traveling being a difficulty in Siberia, the admiral's carriage was attached to the British troop train, and Colonel Ward offered his men as the admiral's escort for the whole trip around the front. Thus it happened that the Russian War Minister inspected his troops with no other guards than British soldiers, who duly accompanied him to the front and marched up to the outpost line with the band playing 'Tipperary.' The tour ended abruptly at Chelyabinsk; instead of going west to Ufa according to program, the admiral and his escort suddenly turned east at top speed for Omsk. On the road they encountered a special train bearing General Boldereff, who held a long private consultation with Kolchak. On the morning of 17 Nov. 1918 they were back in Omsk, and that same night Avksentiev, two other members and the chief of police mysteriously disappeared. Next morning the streets were alive with troops. A batch of officers had spirited the administrators away during the night. There was little doubt that the military party meant shooting. Colonel Ward immediately wrote a bluntly-worded letter to the admiral intimating that British public opinion would regard with profound disapproval any attempt to deal with the arrested men except by proper trial. Kolchak at once gave the required assurances, and two days later the four men were entrained for China under a joint British and Russian guard, and with the train flying the British flag as a precaution. With Boldereff perspicaciously absent and the extreme Socialists arrested there remained but two of the Directorate, Vologodsky and Vinogradov, who promptly resigned their offices and the Directorate became extinct. The council had now to decide whether to retain power itself, which virtually meant a resuscitation of the Siberian government, or to vest it in something or somebody else. The whole procedure was no doubt cut and dried in advance. The council formally assumed the power, fallen upon it by the disappearance of the Directorate, and immediately offered it to Kolchak with the title of "Verkhovny Pravitel" (Supreme Administrator), virtually dictator. Kolchak accepted, thereby completing the *coup d'état*.

Already in April 1918 some British and Japanese marines had been landed at Vladivostok to maintain order. A Chino-Japanese agreement (16 May) assured the co-operation of China to combat German penetration in Siberia. Early in August a small British force landed at Vladivostok to co-operate with an American

detachment and a larger Japanese force; active intervention had been decided upon after lengthy negotiations between the Allied Powers. Declarations were formally made by the American and Japanese governments that the movement of Allied troops into Siberia was not an act of hostility against the Russian people, but an intention to assist them. The Allied force was placed under the command of the Japanese General Otani; besides those already mentioned, his force consisted of French, Italian, Serbian and Rumanian units. Maj.-Gen. W. S. Graves was in command of the American contingent, consisting of two regiments from the Philippines. A British plenipotentiary for Siberia was sent from Hongkong. The Bolshevik government declared the Allied intervention in Siberia to be an act of war against Russia while the Moderates welcomed it as the only feasible measure to crush Bolshevism and to disabuse the Germans of the idea that the road eastward lay open to them. In the fighting along the Siberian line the Czechs and the Russian White Guards gained numerous successes over the Bolshevik forces. In the Far East, however, the operations of the Allied armies did not for some time extend beyond the Amur and Ussuri province north of Vladivostok. By the middle of August 1918 the situation became complicated. The Czechs held the line from the Urals to Irkutsk; the Allies controlled part of the Ussuri region. Between the two lay a formidable army of Bolsheviks and former Austro-German war prisoners, all well equipped and led mainly by German officers. Other detachments of Czechs, still further west in Russia itself, were hard pressed, while neither the British from the Murmansk expedition nor small forces operating from India up through the Caucasus and Transcaspia, were near enough or strong enough to effect a junction. Even in Ussuri the Czechs were in peril until the Allies and a Cossack force under Semenov were able to reach them. The Japanese captured Khabarovsk (8 Sept. 1918), the base on the Ussuri Railroad of the Siberian Bolsheviks, who then withdrew to Blagoveshtchensk. They were cleared from the railway between Lake Baikal and Manchuria and communication was finally established with the Czechs to the west, though it was for some time impossible to relieve the pressure against them. The Bolshevik army indeed grew ever stronger. Americans and Japanese captured Blagoveshtchensk (14,000 prisoners) and Alexievsk on 18 September, when 2,000 Austro-Germans surrendered. Most of the fighting, however, was done by the Czechs and Slovaks. A deep and powerful motive lay behind their heroic exploits. Uninterested in Russian internal affairs, they were goaded into opposing the Bolsheviks when the latter openly proclaimed themselves their enemies. They had no desire to upset one Russian régime for another. Their sole aim was the defeat of the Central Powers and the creation of a free and independent Czecho-Slovak state—to liberate their own country. Wherever they appeared the Bolsheviks fled before them and the populations greeted them as friends and liberators, joining them and re-establishing order. The Allied contribution in men was small and the area of their operations was limited.

During August 1917 Siberia had received the most distinguished prisoners recorded in its annals when the deposed tsar, Nicholas II, and his family arrived at Tobolsk, nearly 2,000 miles east of Petrograd. About April 1918 they were removed to the Crimea, and subsequently to Ekaterinburg, the capital of the Red Ural, on the eastern slope of the Ural Mountains. That town, which is strongly fortified, is the key to Siberia, through which the great railway enters Siberia, and here the Omsk government had decided to establish the base for their operations against the Bolsheviks. The Ural Regional (Bolshevik) Council in Ekaterinburg was seriously threatened early in July 1918 by the approach of Czecho-Slovak forces. At the same time an alleged conspiracy to rescue the tsar was reported to have been discovered. "In view of this fact," a Russian official wireless announced, "the Presidium of the Ural Regional Council decided to shoot the ex-Tsar, Nicholas Romanoff. This decision was carried out on July 16." The Czechs occupied Ekaterinburg a few weeks later.

A Russian army was being raised by the Omsk government in the autumn of 1918 under General Gaida (a Czech) and organized by General Diederichs (a Russian). This force, the "White Guards," elected its own officers and was permeated with indiscipline. Furthermore, there was a general lack of confidence in the purpose of the Allies to defend Siberia. Confusion soon arose over the question of authority. German and Bolshevik agents were busy in all Siberian towns. No measures to secure public safety were undertaken owing to lack of co-operations between Russians and Czechs. American, British, French, Japanese and Italian troops were now penetrating Siberia proper from the east. On the night of 16 Oct. 1918 the first *échelon* of the Allied contingent steamed into the station at Zema, in central Siberia, when the train engineer was immediately held up by armed men and threatened with death if he did not vacate his post and join a strike which had just begun. Colonel John Ward commanded the British force. He instantly took over control of the station, marched a detachment into the town, surrounded the house of the strike leader and arrested him. A proclamation was put up declaring that any workman absent from his post next day would be court-martialed. The troops occupied all the workshops and public buildings during the night, and next morning the strike was over. Armed Bolsheviks surrendered their weapons under penalty of death. This resolute action frustrated a deliberate plan to stop the westward transport of Allied troops. A continuous stream of refugees from Russia poured into Siberia in search of food, drifting into crowded towns in a deplorable state of destitution. Sporadic fighting continued to the end of the year. In January 1919 an agreement was arrived at in Tokio for joint Allied control of the Siberian and Chinese Eastern railways, to restore the efficiency of those lines by a committee of American, British, French, Japanese, Italian and Chinese representatives under the presidency of a Russian. About the same time the question of command was settled. Admiral Kolchak was to remain dictator and nominal commander-in-chief and the French General

Janin was given supreme control of the operations against the Bolsheviks. The British General Knox was placed in command of the rear. Labor troubles, mainly due to delayed payment of wages, led to numerous strikes throughout Siberia, hampering both administrative and military activity. Colonel Ward was sent on a mission of investigation from town to town and to address the workmen, Kolchak promising to support any ameliorative measures proposed.

After the armistice with Germany (11 Nov. 1918) public interest in Siberia waned; opposition grew in America and Great Britain against maintaining troops in Russia. Public opinion in Canada agitated for the return of Canadian troops, of whom about 5,000 were stationed at Vladivostok, but had not been in action against the Bolsheviks. In February these were ordered to be sent home in the spring. Many Czechs, Slovaks and Poles were recalled by their new governments. The Japanese force in Siberia numbered about 73,400 men; of these, about 14,000 were withdrawn at the end of 1918; some 34,000 more were withdrawn during January and February 1919, leaving about 25,000. This reduction was the result of diplomatic representations by the United States government that Japan had sent a contingent in excess of the strength provided for by the inter-Allied agreement, which stipulated a force not exceeding 7,000 men for each of the associated powers. The following figures of the Allied forces that had been co-operating in Siberia were announced in the French Chamber on 26 March 1919 by M. Pichon, Foreign Minister; Czechoslovaks, 55,000; Japanese, 28,000; Poles, 12,000; Americans, 7,500; Serbs and Rumanians, each 4,000; Canadians, 4,000; Italians, 2,000; British, 1,600; French, 760: a total of 118,760 men, plus about 92,000 Russians.

During January the Russo-Czech forces lost the city of Ufa and Orenburg to the Bolsheviks, but made some gains at Tobolsk, Sarapul and Kungur. The Siberian army began an offensive against the Ural front early in March 1919 and captured the towns of Okhansk and Ossa, both southwest of Perm, and Birsik, north of Ufa. On the 16th the Bolshevik *Military Bulletin* reported, "Our troops have evacuated Ufa owing to enemy pressure and are retiring along the railway towards Belebei." At points the Bolsheviks were driven back 20 to 33 miles; masses of panic-stricken prisoners were taken, who reported that from 30 to 60 per cent of their effectives vanished when ordered to advance. The condition of Siberia at this time was one of chaos, misery, starvation, intrigue and bloodshed, "with the smoldering red terror of Bolshevism awaiting to overwhelm all." While the greatest shortage prevailed in the cities and plains, the wharves of Vladivostok were piled up with supplies from America—cotton, machinery, guns and railroad material. Most of this had been landed before the Revolution, and Allied vessels were still pouring in supplies, the distribution of which was hindered by frequent breakdowns on the railway owing to the destruction of tunnels. It was perhaps regrettable that the proposed Allied intervention, based on the Japanese and Chinese armies, had not been allowed to proceed across Siberia on a large scale in the summer of 1918, which might have prevented much bloodshed

and suffering in European Russia. During April-May 1919 the Allies made good progress. Kolchak's forces gained several important points on a front of 100 miles and had established contact with the Allied Archangel line. At Tomsk, 50 miles south of Ufa, a whole regiment of Bolshevik cavalry went over and immediately turned their weapons against their former comrades. On 4 June 1919 the news leaked out from Omsk that the Siberian armies had passed through a serious crisis within the previous three weeks; they had suffered heavy casualties and "could not hope to overthrow an enemy so vastly stronger . . ." A few days later came the report that a Bolshevik army of 40,000 to 50,000 men had seized the valuable Lena Goldfields in the province of Irkutsk, a region lying within the sphere of the Kolchak government. The numerous roving bands of Bolsheviks in the vast spaces of Siberia had never been subdued, and at places remote from the railway were still able to defy the government. For over six months Kolchak had striven in vain to secure the recognition of his government by the Allied Powers. The congress of the Constitutional Democratic party had urged all Russian citizens to unite around Kolchak in the name of the independence of Russia. The Jewish community in the city of Tomsk placed 1,000,000 rubles at his disposal for the army. His government was the only one in Russia approved and recognized by all political parties outside the Bolshevik ring. The Allies, it appears, were still unconvinced as to the political platform of the Kolchak dictatorship; on the questions of its probable survival and eventual acceptance of the terms laid down in the Peace Treaty. Public opinion in America, Great Britain, France and Italy leaned toward recognition. In their reply to Kolchak's notes on the subject the Council of Four formulated (26 May 1919) eight conditions upon which they were willing to continue their assistance (consult *Current History*, New York, July 1919). Kolchak's undertaking of compliance brought the reply from Paris on 12 June that the Allies were "willing to extend to Admiral Kolchak and his associates the support set forth in their original letter." Colonel Ward, on his return to England in June, recorded that only the Kolchak government was capable of restoring law and order. Toward the end of July Mr. Roland S. Morris, American Ambassador to Japan, arrived at Omsk to investigate conditions with regard to the administration. At the same time a financial group in New York arranged to advance a loan of \$5,000,000 to the Kolchak government. On 29 July Mr. Winston Churchill stated in the Commons that Kolchak and General Denikin (the latter in South Russia) were engaging 300,000 Bolsheviks and that the former was continually retreating. On 1 August Kolchak's army was reported in full retreat, demoralized by war weariness. On the 6th an intensive campaign to enlist recruits for the American Expeditionary Force in Siberia was started by the United States Army Recruiting Service. Consult Coleman, F., 'Japan or Germany: The Inside Story of the Struggle in Siberia' (New York 1918). See CZECHO-SLOVAKS.

SIBERIAN RAILWAY. See TRANS-SIBERIAN RAILWAY.

SIBLEY, sib'li, Henry Hastings, American soldier: b. Detroit, Mich., 20 Feb. 1811; d. Saint Paul, Minn., 18 Feb. 1891. He was chosen delegate to Congress from Wisconsin and Minnesota Territories in 1849, representing both in a similar capacity until 1853. He was elected the first governor of Minnesota 1858, and through his personal efforts he successfully brought the Sioux War to a close in 1863. The

later years of his life were occupied with the general educational interests of his State.

SIBLEY, Hiram, American financier: b. North Adams, Mass., 6 Feb. 1807; d. Rochester, N. Y., 12 July 1888. In his early life he worked as shoemaker, and later as journeyman machinist in a cotton-factory. In 1843 he established a banking business at Rochester and later was elected sheriff of Monroe County. He was interested in the early experiments in electric telegraph and aided in securing an appropriation from Congress to further the inventions of Samuel F. B. Morse. He combined with other capitalists, among whom was Ezra Cornell, and consolidated the small existing telegraph companies into the Western Union, which was chartered by the legislatures of New York and Wisconsin in 1856. He was elected president of the company and held the office for 10 years. In 1861, he began the construction of a trans-continental railway that was afterward incorporated with the Eastern systems, making a continuous line from the Atlantic to the Pacific. He projected a telegraphic line with Europe by way of Bering Strait and Siberia and to this end obtained valuable franchises from Russia, but the project was abandoned when the success of the submarine telegraph was assured. After retiring from the telegraph business he engaged in railroading, mining operations and various other industries. He owned large tracts of improved land and was interested in a seed and nursery business at Rochester. He founded the Sibley College of Mechanical Arts at Cornell University and presented Sibley Hall to the University of Rochester.

SIBLEY COLLEGE, a department of Cornell University. See CORNELL UNIVERSITY.

SIBONEY, sē-bō-nā'ē, Cuba, a village 10 miles southeast of Santiago de Cuba near which the United States troops disembarked in the Spanish-American War. It was the scene of a sharp struggle between the American and Spanish forces 23 June 1898. Four troops of Rough Riders, under Colonels Wood and Roosevelt, were ambushed at this point and 16 Americans were killed. Notwithstanding their surprise and losses the Americans charged up the hill with such intrepidity that the Spaniards abandoned their block-house and fortified position, leaving 40 of their dead behind. The village was found to be infested with yellow fever, and in July was burned to the ground at the request of the medical officers.

SIBONGA, sē-bōng'ā, Philippines, pueblo, province of Cebú, on the east coast, 28 miles west of Cebú, the provincial capital. It is on the coast highway, has a good anchorage, and is open to coastwise trade. Pop. 23,455.

SIBUTU, sē-boo'too, an island of the Tawi Tawi group, Sulu Archipelago, Philippines, 30 miles southwest of the island of Tawi Tawi; 18 miles long, two miles wide; area, 36 square miles. The surface is mostly flat, with a conical hill in the centre rising to the height of 500 feet. It is heavily wooded, and the soil is fertile, but there is no agriculture; there is a transient population of Moro and Sulu fishermen and a small village on the southeast coast. This island was found to be nine miles outside the western line of demarcation under the Paris treaty with Spain, and in 1900 was

bought (with Cagayan) by the United States for \$100,000.

SIBUYAN, sē-boo-yān', an island of the Romblón group, Philippines, the second largest and most eastern island of the group, 50 miles north of Panay; area, 90 square miles. It is very mountainous, the highest peak being Mount Sibuyan (6,424 feet); there are three principal rivers, and a number of smaller rivers and streams which furnish excellent drinking water. The island is heavily wooded, and the soil very fertile, but the inhabitants lack thrift and industry, and no attempt is made to develop their natural resources. Some rice, vegetables and an inferior quality of tobacco are raised, for home use only. Gold is found in the sands of the Nailog River, and a number of the inhabitants are engaged in placer mining; trepang and tortoise shells are gathered on the coast. Pop. 18,000.

SIBYL, sib'īl, and SIBYLLINE BOOKS.

Certain women supposed to be inspired by a deity were called Sibyls by the Greeks. Regarding their number and their native countries ancient writers, Greek and Latin, are greatly at variance. Neither Homer or Herodotus makes any mention of a Sibyl; but Heraclitus, the philosopher, who was a little earlier than the father of history, mentions one Sibyl. Aristophanes, Plato and the author of a book, 'Wonderful Stories,' anciently attributed to Aristotle, appear to know of only one Sibyl. Varro, the great Roman polymath, reckons 10 Sibyls, namely the Persic, Delphic, Cumæan (of Cumæ in Italy), Erythræan, Samian, Cuman (of Cymæ in Æolis), Hellespontic, Phrygian, Libyan and Tiburtine (worshipped at Tibur). These Sibyls lived in different epodes, and, according to Pausanias, the earliest was the Libyan; he refers the Erythræan Sibyl to the time of the Trojan war; his third Sibyl is the Cumæan (of Italian Cumæ), the most celebrated of them all. In the traditional history of the Roman kings, she sold to Tarquin the Proud the Sibylline books. First she offered him nine; these refused, she burned three and offered, at the same price, the remaining six; Tarquin again refused to buy, whereupon three others were burned and the last three offered, still at the same price, and were bought by Tarquin. In these books was written the fate of the Roman people and state. They were entrusted to a commission of 15 members, who were to consult them on occasions of public danger, for direction as to the religious observances necessary to avert extraordinary calamities and to expiate prodigies; they were written in Greek hexameter verses, and hence, the commission of the Quindecimviri Sacris Faciundis was always assisted by two Greek interpreters. The books were preserved in a stone chest deposited in the temple of Jupiter Capitolinus and were destroyed by the fire that consumed the temple in the year 83 B.C. To recover the Sibylline prophecies, the Senate seven years after sent ambassadors to Erythræ in the Troad, who brought back thence about 1,000 verses; other verses were collected in Ilium, Samos, Sicily, Italy and Africa. In addition there came into circulation about this time a great many so-called Sibylline oracles. Augustus, 12 A.D., ordered strict search to be made for these, and a great many of the

spurious oracles were burned; the authentic Sibylline verses after being subjected to critical revision, were deposited in the temple of the Palatine Apollo: they appear to have been still in existence as late as the year 400. The Fathers and other Christian authors often quote the Sibylline verses as containing prophecies of Christianity: a memorable instance of this is the coupling of Sibylla with David in the first stanza of the *Dies Iræ*—*teste David cum Sibylla*, witness David with the Sibyl, as both of them prophesying the destruction of the earth by fire: these Sibylline verses were undoubtedly spurious, most of them composed by learned Jews of Alexandria in the century next preceding our era; such of them as have come down to our time have been collected and repeatedly printed. Consult Renan, 'Hist. du peuple d'Israël' t. v., l. iv., ch. 9, 'La Sibylle Juive.'

SICARD, sīk'ārd, Montgomery, American naval officer: b. Utica, N. Y., 30 Sept. 1836; d. Westernville, N. Y., 14 Sept. 1900. He was appointed acting midshipman in 1851 and rose to be lieutenant in 1860. He was assigned to the Gulf blockading squadron in 1861 and as executive officer on the *Oneida* was engaged at the bombardment of Forts Jackson and Saint Philip. He assisted in the destruction of the Confederate flotilla in 1862, participated in the passage of the Vicksburg batteries and commanded in the engagement with the Confederate ram *Arkansas* in that year. He was in command of the *Seneca* in both attacks on Fort Fisher and was in charge of the left wing in the naval land assault on that fort 15 Jan. 1865. He was engaged in various commands after the Civil War, was inspector of ordnance at the Boston navyyard in 1880-82, chief of the bureau of ordnance in 1882-90, and in 1894-97 he was successively in command of the Portsmouth and Brooklyn navyyards. He was appointed commander-in-chief of the North Atlantic Squadron in 1897 with rank as rear-admiral, but at the outbreak of the Spanish War was placed on sick leave. After partial recovery he asked for active duty and was appointed president of the board of strategy. He was retired in 1898 after 47 years of service.

SICARD, sē-kār, Roch Ambroise Cucuron, educator of the deaf and dumb: b. Fousseret, near Toulouse, 20 Sept. 1742; d. Paris, 10 May 1822. He was appointed in 1786 director of a school established for the training of deaf-mutes by the archbishop of Bordeaux. In 1789 he removed to Paris, and was chosen successor to the Abbé l'Épée as director of the Paris Institution for Deaf-mutes. He made some important improvements in the system of his predecessor. During the Revolution he narrowly escaped with his life; and having under the Directory become one of the conductors of the 'Annales Religieuses,' it was only by concealing himself that he avoided the consequences of a sentence of exile pronounced against himself and other journalists. On the overthrow of the Directory he resumed his duties at the school of instruction for the deaf and dumb, and in 1816 he was made member of the Academy. Besides other works, he was the author of 'Cours d'Instruction d'un Sourd-muet de Naissance'; and 'Théorie des Signes pour l'Instruction des

Sourds-muets.' Consult Berthier, 'L'Abbé Sicard' (1875).

SICCA, a weight in India of about 180 grains troy. The sicca rupee, formerly a current coin in India, contained about 176 grains of pure silver, and was equal to about 50 cents.

SICILIAN VESPERS, the name given in history to the massacre of the French at Palermo, Sicily, on Easter Monday, 30 March 1282, because the first stroke of the vesper bell was the signal agreed upon for the massacre to begin. Charles of Anjou, brother of Louis IX of France, had become master of Naples and Sicily by the defeat and death of King Manfred at the battle of Benevento, and the execution of Conradin, Manfred's nephew, and rightful king, who was only about 16 years of age. Charles treated his Sicilian subjects as a conquered people, and the French garrisons in Palermo and other places committed the gravest outrages upon the inhabitants. Women especially were victims of the brutal soldiery, and the animosity of the Sicilians toward the French became aroused to a high pitch. Meantime Giovanni di Procida, a nobleman who had been deprived of his estates by Charles for his fidelity to Manfred, was actively seeking to bring about the expulsion of the French from Sicily. Constantia, a daughter of Manfred, was married to King Peter, of Aragon, and Procida appealed to Peter, and also procured the necessary means to enable Peter to move against Charles. The Sicilians, encouraged by Procida, and directly inflamed, it is stated, by a gross insult offered to a young Sicilian bride by a French soldier, planned a general uprising and massacre. At the appointed signal the people of Palermo fell upon the French, sparing neither age nor sex, and cutting off also Sicilian women who were companions of Frenchmen. The number massacred was about 8,000. Messina in April followed the example of Palermo, and while Charles was besieging Messina, King Peter landed at Palermo with 10,000 foot-soldiers and 800 men-at-arms. Charles fled to Calabria, and the succession to the crown of Sicily was settled on James, the second son of Peter and Constantia, the ultimate result being the independence of Sicily under Frederick, a brother of James.

SICILIES, sis'i-liz, **The Two**, a former kingdom of Italy, consisting of Naples and Sicily. After the fall of the Western Roman Empire (476 A.D.) Lower Italy became subject to the Ostrogoths. About the middle of the 6th century Naples and Sicily fell under the power of the Greek emperors. Both countries were subject to one governor, the exarch of Ravenna, who conducted the administration by means of dukes. During the contest between the exarchs and Lombards there sprang up, in the 9th century, several independent duchies, such as Salerno, Capua and Tarento. The most powerful was the Lombard duchy of Benevento. Naples, Amalfi and Gaeta maintained themselves as republics. About the same time the Saracens invaded Calabria from Sicily. They conquered Bari and contended with the Greeks for the possession of Lower Italy, until the Emperor Otho I (967) subjected Benevento to the German Empire. Germans, Greeks and Arabs now struggled for the possession of this

beautiful country. This induced some warlike adventurers, Normans from France, in the 11th century, to try their fortune here. They assisted the Greek duke Sergius against Prince Pandorf of Capua, and were rewarded with the tract of land on which they founded the town of Aversa. More Normans soon followed. In 1047 the 12 sons of Tancred de Hauteville, a count in Lower Normandy, came in with their followers. Among these brothers Robert Guiscard was the boldest and most artful. He contrived to gain over the peasants and formed out of them his best soldiers. His policy led him to hold Apulia, which he had conquered, as a papal fief (1053); and he promised likewise to hold as papal fiefs such tracts as should afterward be subdued by the Normans in Calabria and Sicily. He then (1060) took the title of Duke of Apulia and Calabria. His youngest brother, Count Roger, conquered Sicily in 1072, and, after the death of Count Robert and his sons, united in his own person the whole power of the house of Hauteville. His son and successor, Roger II, completed, after 1101, the conquest of all Lower Italy by subduing Capua, Amalfi and Naples, at that time celebrated commercial republics. He then received, in 1130, from the Anti-pope Anacletus II, by whom he was solemnly infeoffed, the title of king of Apulia, Calabria and Sicily. Uniting Sicily to his Italian dominions he now called his kingdom the kingdom of the Two Sicilies. This union of Naples and Sicily continued 150 years. Each country preserved its existing laws.

In 1268 Charles of Anjou, brother of Louis IX of France, caused the legitimate heir, Conradin of Swabia, to be beheaded. Sicily freed herself in 1282 from the oppressions of the French by the aid of King Pedro of Aragon, and Naples was now separated from it, Sicily being under the kings of Aragon, while Naples was under the Angevin dynasty. This dynasty was dispossessed in 1442 by Philip V of Aragon, who bestowed Naples on his natural son Ferdinand.

In 1504 Sicily was again united to Naples under the Spanish crown, and governed by viceroys till 1713, when the Peace of Utrecht again divided the Two Sicilies, Naples falling to Archduke Charles of Austria, Sicily to Duke Victor Amadeus of Savoy. King Philip V of Spain reconquered Sicily in 1718, at the instigation of Alberoni, but was forced to cede it to Austria in 1720, Savoy receiving Sardinia in exchange, by which means the Two Sicilies became a part of the Austrian dominions. In 1734 the Spanish Infante Don Carlos, son of Philip V, at the head of an army invaded Naples, conquered both the continental and the insular part of the kingdom and was crowned at Palermo in 1735 as Charles IV. This change was sanctioned by the Treaty of Vienna (1783), and till 1860 this line of the Bourbon family maintained possession of the Two Sicilies, except for a few years during the Napoleonic period, when Joseph Bonaparte and Joachim Murat reigned on the mainland as kings of Naples. In 1759, when Charles IV ascended the Spanish throne under the name of Charles III, he conferred the kingdom of the Two Sicilies on his third son, Ferdinand, and decreed at the same time that it should never again be united to the Spanish monarchy. The reign of Ferdinand extended through the stormy period of the French Revolu-

lution and the subsequent European commotions. His successors, Francis I, Ferdinand II (Bomba) and Francis II were despotic tyrants who forced the people into periodic revolt, put down with much severity. In 1860, however, an insurrection broke out in Sicily, and an expedition of volunteers from Piedmont and other Italian provinces under Garibaldi sailed from Genoa to the assistance of the insurgents. The result was that the Neapolitan troops were driven from the island. Garibaldi, following up his success, crossed over to the mainland, where he met little or no opposition; Francis II fled from Naples; the strong places in his hands were reduced; and by a popular vote the kingdom of the Two Sicilies ceased to exist as such and became an integral part of the kingdom of Italy. See ITALY.

SICILY, the largest, most fertile and most populous island in the Mediterranean, belonging to Italy, was formerly a part of the kingdom of the Two Sicilies (q.v.). It is separated from the mainland of Italy by the deep but narrow Strait of Messina, which is from $2\frac{1}{2}$ to 14 miles wide and 24 miles long. In shape the island resembles a triangle, hence the Greeks named it Trinacria, the "three-cornered." Sicily extends from lat. $36^{\circ} 38'$ to $38^{\circ} 18' N.$; long. $12^{\circ} 25'$ to $15^{\circ} 35' E.$ From the Saracen period until the beginning of the 19th century the island was divided into three districts, but in 1817 it was divided into the following seven provinces, each with a chief city of the same name:—

PROVINCES	Area in square miles	Population, 1915
Caltanissetta.....	1,271	354,288
Catania.....	1,907	819,944
Girgenti.....	1,175	409,133
Messina.....	1,254	537,348
Palermo.....	1,927	804,580
Siracusa.....	1,433	500,664
Trapani.....	968	367,507
Total.....	9,935	3,793,464

Physical Features.—A range of mountains commencing in the northeastern extremity of the island stretches across it taking the name first of the Neptunian and then of the Madonian Mountains. The whole range bears a strong resemblance to the branch of the Apennines which stretches to the southern extremity of Italy and strongly countenances the opinion generally entertained that it was originally continuous with it and that Sicily consequently must at one time have been a part of the European continent. The most remarkable natural feature of Sicily and one of the greatest wonders of the world is Mount Etna (q.v.), which attains a height of 10,874 feet. Compared with this all the other summits of the island are insignificant, the loftiest of them, Calatabellota, Monte Cuccio, Monte Scuderi and Dinnamare over Messina being all between 3,000 and 4,000 feet. The great majority of the mountains have a far less average height. Their sides are generally covered with magnificent forests. The rivers and streams are very numerous, and not a few of them of classical celebrity, but

they are individually insignificant, and in summer are often almost without water. None of them are navigable. The most deserving of notice are the Giaretta or Simetus on the east coast, the Salso, Platani, Calatabellota or Isbura and Belice on the south and southwest, and the Termini, Fiume Grande and Pollina on the north. There are no lakes worthy of the name; the largest is Lentini, not far from the east coast.

Climate.—The climate is excellent and, except in some spots where the air becomes tainted by the effluvia of morasses and stagnant pools, very healthy. The mean temperature in August, the hottest month, is $78^{\circ} F.$, and in January, the coldest month, 52° , a difference of only 26° . On the hottest days the thermometer rises to 90° and 92° . The sky in summer is for the most part beautifully clear and serene, but after the autumnal equinox dews and fogs increase, and rain falls in frequent and heavy showers. The most annoying wind is the southeast or sirocco, which, blowing from the deserts of Africa, is almost intolerable from its stifling heat. Much rain falls in winter, usually commencing in November, and continuing to fall at intervals, often in very heavy torrents, with vivid lightning and occasional snow-storms, till March, while not infrequently, particularly in the interior, long droughts prevail from April to November, to serious injury of the harvest and vintage.

Geology.—Etna itself, and the large circular space of which it forms the centre, extending west to Bronte and east to the coast over the whole tract that lies between Catania and Taormina, is covered completely with volcanic products. Granite, with gneiss and mica-schist, has its only large development in the northeast. The Jura-limestone occupies only two small patches; but the series of rocks immediately above the limestone and belonging to the Cretaceous system are so largely developed as to cover at least a half of the whole surface of the island. The rocks of the Tertiary formation occur chiefly in the southeast and the west. The minerals of Sicily are more numerous than valuable. They include argentiferous lead, quicksilver, iron, copper and antimony in quantities so limited that few of them are worked; lignite, bitumen, petroleum and naphtha; asbestos, gypsum, emery, alum, rock-salt, nitre, sulphur and a great variety of marbles, agates, amber, chalcedonies and jaspers. The most important of all these is sulphur, which has been worked in mines for more than three centuries and about 400,000 tons is exported yearly. There are some 300 of these mines.

Vegetation, etc.—Both the climate and rich soil of the island procure for it both a very large amount and great variety of vegetable products. The hilly regions, presenting alternately bold crags and undulating slopes, are generally clothed with forests of fine timber, among which the prevailing trees are oak, ash, pine, elm and chestnuts; or covered with pastures, on which numerous flocks and herds are reared. In the lower grounds cultivation is general, and the crops are often remarkable for their luxuriance, though the mode of culture is rather unskilful and careless. The most important crops are wheat, maize, barley and lentils or other pulse. Next to grain the most important objects of culture are the vine

and the olive, the orange and the lemon. The produce of the vine is partly dried into raisins but is much more frequently converted into wines of various kinds and generally of rich flavor. Sicily sends out two-thirds of Italy's wines. Other vegetable products deserving of notice are the mulberry, extensively used in rearing silkworms; saffron and sumach; cotton, which has its chief locality near Mazzara; manna obtained by incisions in the bark of a species of ash, various species of fruit, more especially the Indian fig or prickly-pear, on which when in season great numbers of the lower orders subsist, the almond, common fig, date, liquorice-plant and sugarcane. To these might be added a great number of trees and plants valuable for fruit, fibre, medicinal properties or the essences extracted from them.

Manufactures, Trade, etc.—The manufactures, which are not very important, include the ordinary silk, woolen, linen and cotton tissues, for the most part of a coarser description; oil-cloths, leather, cordage, glass, earthenware, etc. Trade suffers much from want of inland communication, but the vast extent of sea-coast and the many valuable products indigenous to the island will in time make it much greater than it is at present. The only occupation for which the Sicilians seem to show any particular predilection is that of fishing, for which they possess numerous advantages, the sardine and tunny fisheries along the coast being the finest in the Mediterranean. The most important articles of export are oranges and lemons, wines, essences, sulphur, olive-oil, sumach, silk, liquorice and cream-of-tartar; of imports, colonial produce, cotton and woolen yarn, silk, linen, cotton and woolen goods, hides, hardware, etc. Commerce is mostly in the hands of English and Swiss; before the war a large part was controlled by German firms. About 1,000 miles of railways are in operation.

Religion, Education, etc.—The Roman Catholic is the established religion and the great body of the people nominally belong to it, though a considerable number of Greeks, who profess the worship of their own church, live in different parts of the island, and more especially in the vicinity of Palermo. Education is much neglected. As late as 1864 upward of nine-tenths of the population were wholly uneducated. National schools are now, however, everywhere established, and the towns possess commercial and grammar schools. Lower grade education is compulsory. Palermo, Catania and Messina can even boast of universities, with a student roll (1914) of 1,803, 1,254 and 458 respectively.

History.—According to early tradition the first inhabitants of Sicily were Cyclopes and Lestrygonians, a kind of fabulous beings, who long furnished the poets with ample materials, of which, among others, Virgil has largely availed himself. Certain it is that among its inhabitants, invaders and rulers, Sicanians and Sikelians (Siculi), Phœnicians, Carthaginians, Greeks, Romans and Byzantines, Vandals, Saracens, Normans, French, Germans, Spaniards and Neapolitans have succeeded one another and none of these successions was without its accompaniments of violence and destruction. Invasions, conquests, tyrannies, exactions, revolts, rebellions, repressions, massacres, pestilences

and famines have been terribly frequent incidents in the history of the island. To this list must also be added the ravages of earthquakes and volcanic outbursts. Sicanians (Sicani) from Iberia were the earliest known inhabitants of Sicily, who gained such a footing in the island as to change its name from Trinacria, which it had hitherto borne, to that of Sicania. The Aryan Siculi, driven from Italy, crossed the straits and having vanquished the Sicanians, gave the island the name which it still bears. After a considerable interval the Greeks began to plant colonies on the coast, and founded a number of towns, of which Syracuse, Agrigentum and Messina became the most celebrated. They were not, however, allowed to remain in undisturbed possession. The island was conquered first by the Carthaginians and next by the Romans; and on the decline of their empire, it was overrun by the Goths, who retained possession till Belisarius expelled them. In the beginning of the 9th century the Saracens became masters and continued so till their expulsion by the Normans, who remained long enough in possession to establish the feudal system in all its rigor. For a continuation of the history of Sicily see *SICILIES, THE TWO*, and also *ITALY*. A., 'History of Sicily' (4 vols., Oxford 1891-84); Hare and Baddeley, 'Sicily' (London 1905); Holm, 'Geschichte Siziliens im Alterthum' (1870-98); Macmillan's 'Guide to Italy and Sicily' (London); Wermert, G., 'Die Insel Sicilien' (Berlin 1905).

SICK, Foods for the. That diet is one of the strongest factors in the control as well as in the progress of certain types of disease is practically an axiom to this generation and one appreciated, especially by the nurse upon whom falls the carrying out of the doctor's orders. Strict observance of a regimen prescribed by the physician in charge of a case, with no pampering of a patient's preferences and no indulgence of a person's own theories, is the stern duty of one who would most fundamentally and materially alter a diseased or abnormal physical condition. Very frequently there is increased demand for food in sickness, too often associated with partial or complete inability to take it or, if it is taken, to digest it properly; gastric secretions are almost always perverted in acute or chronic diseases and appetite and taste, under normal conditions a safe criterion, may have to be disregarded in abnormal circumstances.

Too much care cannot be given to the service of meals during illness. The psychological influence exerted upon a healthy person by the manner of the preparation of food is now proved to be very great as an actual aid to appetite and digestion, though it has been practically ignored for centuries. How greatly exaggerated this influence would be in illness may be readily perceived. Therefore, the invalid's tray must be made attractive at any cost of effort or even of time on the part of the nurse; it is her special province, and perhaps the only one in her professional sphere in which she may give play to her æsthetic sensibilities. It is, therefore, not true that a woman without æsthetic sense makes

the best nurse, for this especial reason of attractive service and for the very potent reason that an invalid with any æsthetic perception (made keener by illness) will need a nurse's sympathy and appreciation of his condition and point of view.

All service should be upon the very best china and linen available, with variation in these if possible; the least novelty or diversion is acceptable, as the strongest people are often reduced by illness to childlike attitudes. A freshly cut flower on a tray adds greatly to its first effect upon a patient and attractive garnishes to even unattractive dishes may be devised by a skilful nurse. The color of paps and gruels is not appetizing; the color of beef juice is absolutely revolting to very many; therefore, opaque ware is to be selected for serving such. If a bent tube be used for the patient to take liquids with, much discomfort of sitting up or disgust at seeing what is being taken may be avoided. In quantity the service must be underestimated rather than overestimated; sufficient porridge for a day laborer will have little charm for a patient with no appetite. Care must be taken in conveying the tray that nothing upon it be spilled or smeared. Too much stress cannot be put upon these points.

A nurse must know the underlying principles of food values and their chemical composition, as well as the proper preparation of foods of each class to make its essential properties best available to the disturbed digestion. She must know that steak or chop slightly broiled is more easily digested than the "well-done" variety; that an egg slightly boiled, or one well mixed with air by beating, gives up its albumen with least resistance to the digestive juices. On the other hand, starchy foods must be long subjected to boiling temperature that the starch-cells may be ruptured, and digestion of them, so difficult even in health, be begun for the invalid. Seasoning and especially the handling of the smell of food, is a more important point in sick-cooking than under ordinary conditions, and may be used extensively on account of the mild stimulating action of condiments on the gastric juices, as well as for their flavor, although a judicious nurse will not apply this principle to excess. Tea, chocolate, cocoa and coffee may be used with moderation except in certain troubles in which they will be specially forbidden; they combine slight restorative power with some nutritive value and at least do no harm.

The time of administering food is another important point. In but few instances is sleep to be interrupted for the sake of a meal. The best times are when the patient has been quiet for a while and can be quiet for at least an hour more; that is, undisturbed by visits from doctor or friends, by baths or bedmaking, or anything tending to excitement. If a fever is present the most abundant meal of the day should be given when the fever is at its lowest, as gastric juices are least active in presence of fever.

Food may be selected in some measure with regard to the affected part. Throat and lung troubles demand non-irritating foods, or even those of a soothing character, as flaxseed tea; a disease involving the stomach would demand food the digestion of which is accomplished in

the intestines, as carbohydrates or starches; and vice-versa. The quantity and total amount are determined by the patient: a suppurative process demands much and frequent feeding, as it uses tissue at an almost unthinkable rate; the cure of consumption is largely a stuffing process; in some acute illnesses food may be withheld for over 24 hours with great benefit, but the diet must be very carefully guarded when food is resumed. Some of the more important foods for the sick are here given, with modes of preparation and some indications of their spheres of usefulness.

Liquid Foods Made of Water.—Used as cooling drinks in fevers.

Lemonade.—This is best prepared by making a syrup of one cup of water and one-half cup of sugar, boiled 5 or 10 minutes. Make the drink as it is needed in the proportions of two tablespoonfuls of syrup to one of lemon-juice and one-half cup of water. Mineral waters may be substituted for plain water, especially when the stomach is irritable.

Orangeade.—Use one and one-half tablespoonfuls of the same syrup as for lemonade and the juice of an orange—less if the orange is sweet. Pour over crushed ice.

Grape-juice.—Thoroughly clean one and one-half cups of Concord grapes, add one cup of cold water and cook one and one-half hours in a double boiler. Add one-half cup of sugar, strain and cool.

White grape-juice and ginger ale, half and half, makes a pleasing mixture for many convalescent patients. Cut orange, maraschino cherries and a sprig of mint give it an attractive bouquet.

Irish Moss Lemonade.—Soak one-quarter cup of Irish moss in cold water to cover it; remove this, add two cups of fresh water and cook 20 minutes in a double boiler. Strain and to one-half cup of liquid add sugar and the juice of one lemon.

Flaxseed Lemonade.—Into one pint of boiling water put two tablespoonfuls of sugar and three of whole flaxseed. Steep one hour; strain and add the juice of a lemon; serve direct from the ice. This is desirable in throat and lung troubles, giving relief as well as affording some nutriment. It is very soothing in tonsillitis.

Potus Imperialis.—To one quart of boiling water add one-half ounce of cream of tartar, the juice of a lemon and two tablespoonfuls of sifted sugar or strained honey. Cover this until cold. This is a useful drink in fevers if the urine is high-colored or scanty.

Egg-water.—The white of one or two eggs well beaten is to be put into one-half pint of ice-water with a little salt or sugar. This may be given to the weakest patient and will almost invariably be retained, while the albumen will afford necessary nourishment. The water may be flavored with sherry or may be changed to lemonade, orangeade or grape-juice. Almost any fruit-water is refreshing to a patient, especially if he is suffering with fever or chronic disease or convalescing. The acids and salts of fruit are valuable food additions, though they may not be relied on to furnish nourishment to any appreciable extent. Rhubarb drink well prepared is very refreshing and almost always beneficial; green gooseberries and mulberries afford a variety in their season and all

the juicy berries of summer make good drinks. The liquid for all these should be perfectly clear after straining and never contain any pulp or seeds.

Gum-arabic Drink.— Make with one ounce of gum-arabic to one pint of boiling water, seasoned with two tablespoonfuls of sugar, sherry and the juice of a large lemon.

Bran-tea.— To one pint of wheat bran add one quart of boiling water; keep this hot, but boil less than one hour. Strain and serve with sugar and cream. Corn-tea is made in the same proportions of parched corn ground in a mortar.

Toast-water.— Cut stale bread in one-quarter-inch slices and dry thoroughly in the oven until crisp and brown. Break into small pieces and add an equal quantity of boiling water; all this to stand an hour; then season with salt, strain and either chill or reheat. A little wine may be added. This is often beneficial in cases of extreme nausea.

Rice-water.— Wash two tablespoonfuls of rice and add two cups of boiling water. Stick-cinnamon or lemon-peel may also be added. Boil one-half hour, strain and reheat or chill as desired.

Barley-water.— Soak three tablespoonfuls of barley overnight; boil in four cups of cold water for one and one-half hours; strain and season with salt, lemon-juice and sugar. The starch of barley is very beneficial for diminishing a laxative condition.

Oatmeal-water.— Take one-half cup of fine oatmeal with one quart of boiled water; set in a warm place for one and one-half hours; strain and cool. It makes an excellent summer drink, is always safe in quantity in the hottest weather and is valuable in diarrhoea of children.

Macaroni-water.— Indian meal or any of the starchy foods may be used for this water in similar ways. Above all, such waters must be made palatable and should be served in a manner that does not betray their weak character. By increasing the amount of cereal and by longer boiling, a gruel may be made.

Oatmeal Gruel.— Boil one tablespoonful of oatmeal in one pint of water three-quarters of an hour; strain it and if too thick reduce to desired consistency with boiling water. Season with salt.

Oatmeal Gruel with Milk.— This is made by soaking the oatmeal in water overnight in proportions of half as much cereal as water. Boil an hour in the same water, then blend thoroughly with one pint of boiling milk and boil five minutes more.

Caudle.— Beat one egg to a froth, add a wineglass of sherry and one-half pint of any kind of gruel; flavor with nutmeg, lemon-peel and sugar.

Gruels are comprised under the head of semi-solids. Discretion must be used in the administration of gruel when symptoms of inflammation are present, since starch in general, and corn or oatmeal gruel in particular, are very heat-productive. Care must always be taken in making gruels to cook them thoroughly, that the starch may be made altogether available to a weak digestion. Arrowroot is advisable as an especially digestible gruel and of avail even in the presence of irritation of the stomach.

Mulled Wine.— Soak broken stick-cinnamon and one-half dozen cloves in one-half cup of boiling water for 10 minutes. Strain and add the beaten whites of two eggs and two tablespoonfuls of sugar. Into this pour from a height one cup of sweet wine that has been boiled (but not in tinware). Pour from glass to glass several times to make it light.

Pap.— Thicken one pint of milk with one tablespoonful of flour; cook 10 minutes and beat in the white of an egg if desired. Corn-starch, rice-flour and arrowroot are used also in this way as thickening.

Plum Porridge.— Mince 12 raisins and bring them to a boil in one pint of milk; thicken with one teaspoonful of corn-starch in a cold-water paste and boil five minutes; strain and serve. Raisins impart a fruity taste that gives variety, and they afford the easily-digested fruit-sugar. This is of service in diarrhoea.

Sago-milk.— Take one tablespoonful of pearl sago, wash and soak it overnight in four tablespoonfuls of cold water. Boil the sago with one quart of milk in a double boiler until the sago is dissolved. Sweeten slightly and serve hot or cold.

Treacle Possett.— Boil a cup of milk and stir in one tablespoonful of molasses. Bring this to a boil and strain before serving.

Milk preparations may be provided in great variety and often with the most desirable results. The more useful of them are specified below.

Albuminized Milk.— The white of one egg, one-half cup of milk and a pinch of salt are shaken together thoroughly and chilled.

Milk Punch.— To one-half pint of milk add one tablespoonful (or less, according to case and individual) of whiskey, rum, brandy or sherry, sugar and a few gratings of nutmeg. Mix, cover and shake well. The milk may be hot if so desired.

Kumiss.— Dissolve one-third of a yeast-cake in one tablespoonful of lukewarm water; add this to one quart of warm milk to which one and one-half teaspoonfuls of sugar has been added; fill strong bottles to the neck and cork them firmly; then invert them and allow them to remain for fermentation at about 80° F. Chill after six or eight hours. Remove the corks with care or draw off the kumiss with a champagne tap.

Sterilized Milk.— Fill perfectly clean pint bottles with milk almost to the top and plug with absorbent cotton; place all the bottles in a steamer so arranged that they will not touch the bottom or each other. Immerse in cold water to three-fourths their height and bring this bath to the boiling point; keep it at 170° F. for about 10 minutes. Remove cotton plugs and cork bottles with rubber corks if possible, keeping them in a cool place until used; then use the milk only once, never offering a second time even to an infant.

Pasteurized Milk.— This is similarly prepared, but the water is on no account allowed to boil and is kept at 167° F. for 30 to 60 minutes. Special pasteurizers are available for this purpose.

Peptonized Milk.— Mix thoroughly five grains of pancreatic extract and 15 grains of bicarbonate of soda in two tablespoonfuls of water; add one pint of fresh milk and keep warm (about 115° F.) in a covered jar for one-

half hour; then chill the mixture. If the resulting slightly bitter taste is disagreeable, the preparation may be sweetened. Peptonizing tubes may be bought all prepared for use in this process.

Water and fresh milk, boiled in equal parts, will afford relief in cases of mild exhaustion, being quickly absorbed with the least possible effort. In giving milk to a patient the most important point to observe is very slow administration; it must be eaten rather than drunk, even under normal conditions, and a weak stomach cannot manage its curd in bulk. Lime-water or bicarbonate of soda, added in small quantity to milk in cases of acidity of the stomach, may prevent the formation of curd. In bad cases of nausea milk may be retained if fed by the teaspoon at short intervals. In all cases of milk diet in whole or in part it is safer to pasteurize or sterilize the milk unless one is perfectly sure of its source and its mode of transportation. This would practically obviate any risk. The change from a solid to a milk diet must be made gradually; also, if the case no longer warrants all liquid, the change back to solid must be gradual, as the digestive system will rebel at sudden alterations in regimen. The amount of milk to be given daily, its modifications and the frequency of administration will be regulated by the physician in charge of the case.

Beef preparations are likewise made in many ways, so as to adapt them to different patients in various circumstances. Those described below will all be found to possess special advantages.

Beef-tea.—A pound of beef cut from the round or neck is cut into very small pieces, put into an earthen or porcelain pot, covered closely and allowed to soak in one quart of cold water for an hour or two. Heat in the same vessel to the boiling point, then allow the preparation to simmer two hours, or until the salts and soluble albumen of the beef are quite extracted. Season this and strain it or not, as desired; remove all fat, however, when the tea is served, as the least trace of fat is disgusting to a sick person. A perfectly clear liquid may be obtained by stirring in the beaten white of an egg and again straining. This beef-tea is stimulating, but by no means nutritive, as most of the albumens have been precipitated by the heat; so discretion must be used in its administration, since it may excite a weak patient and prevent sleep.

Beef Essence.—Finely mince one pound of lean beef (no fat); put into a fruit-jar, cork tightly and set into a kettle of cold water over a slow fire; let it boil three hours, then strain through a sieve and season with salt and red pepper. Another method of preparing this beef essence, which has some nutritive value in addition to the stimulating quality, is to add one pint of cold water to the minced beef in the jar, allow it to macerate for three hours, with occasional stirring, and to simmer in the water bath after it has once come to the boiling-point. Strain as before and wash the remainder with cold water to make the whole measure one pint. Vary the flavor if it is often given by bay-leaf, clove, mace, celery or other aromatic substance.

Peptonized Beef-tea.—To one-half pound of raw lean beef that has been finely minced add 10 grains of pepsin and three drops of

dilute hydrochloric acid. Put in a tumbler, cover with cold water and stand for two hours in a warm place (about 90° F.), stirring frequently. This should always be used the day it is made, although most of the other beef preparations may be kept sterile on ice for some time.

Bouillon and Consommé.—These may be given to a convalescent as usually prepared; they are too stimulating, however, for a weak patient.

Beef-juice.—Broil one-half pound of lean juicy beef over a hot fire, turning frequently, merely to the point of heating the meat through; cut the meat into dice, and extract the beef juice with a meat-press or a lemon-squeezer. Heat the extract by setting in a dish of hot water; never apply enough heat to coagulate the juices, as they would be rendered less digestible, defeating the express purpose of this preparation. This is highly nutritive. Broiled beef-tea is the same preparation diluted, as the case or individual may require, by hot (not boiling) water.

Frozen Beef-tea.—It is often desirable to administer nourishment as pleasantly as possible in hot weather, or in a case of high fever. Any of the beef-teas given above may be frozen. In small quantities it is most convenient to fill a pound baking-powder tin, or other tin case, two-thirds full, and pack with ice and salt in a small pail; stir and beat as the mixture freezes until a consistency of mush is obtained.

Beef-juice and Cereal.—Use one tablespoonful of thoroughly cooked oatmeal or other cereal to two tablespoonfuls of boiling water; add one cup of strong beef-tea; bring all to the boiling point; season well, and serve with toast or crackers.

Bartholow's Food.—Soak one ounce of sago in one-half pint of milk for 10 minutes. To this add one-half pint of beef-tea, the yolk of an egg, beaten, and seasoning of celery salt. This is considered a complete food.

Scraped Beef Balls.—A small piece of round steak is cut into strips, and the freshly-cut surface is scraped with a rather dull knife, reserving all the soft part of the meat and leaving connective tissue. Form the pulp into balls, using but slight pressure; season with a very little pepper and salt. The balls may be either broiled or cooked in an omelet pan that is sprinkled with salt. Serve on toast, and garnish as prettily as possible to divert attention from the raw appearance of beef. The flavor may be altered, if the patient's digestion allows, by additions of minced celery, chopped almonds or other nuts, butter or egg albumen.

Raw Beef Sandwiches.—Use the raw scraped beef, well seasoned with salt; cover half a slice of bread that is cut very thin and buttered; press down the other half, and serve. The object is to serve this raw beef (as attractively as possible) because of its nutritive qualities; the rareness, being often distasteful, must be disguised.

Mutton Broth.—Wipe and clean from skin and fat three pounds of mutton from the neck; cut in small pieces, and put all into a kettle; cover with cold water and bring slowly to boiling-point; then simmer for more than two hours, or until meat is perfectly tender. Strain, skim and add rice or barley.

Veal Broth.—This may be made with one-

half pound of veal, chopped fine, to one pint of cold water. Prepare in same way as mutton broth.

Chicken Broth.—Select an older fowl for this, as it makes a more nutritious broth. Remove skin and fat; disjoint and break the bones. Cover with cold water in stew-pan, bring to boiling-point slowly, and simmer for several hours. Season with salt and a little pepper when half done. Strain and remove fat. Rice may be boiled with it at first, and strained out, or it may be added and boiled in the stock.

Chicken Panada.—Chop and rub fine one-quarter pound of the white meat of chicken, raw. Mix with one-half cup of fresh bread crumbs and one-half cup of milk; beat in the whites of two or three eggs. Season and poach in little earthen cups.

Oyster foods have also their peculiar values, and a few of the numerous forms of preparation are here given.

Oyster Juice.—Mince with a silver knife one dozen fat oysters, put them into a fruit-jar and stand in hot water for half an hour. Strain the liquid out, skim and season. This may be diluted or served in concentrated form.

Oyster Broth.—Add one-half pint of cold water before putting the jar, as above directed, in the hot bath. Or the broth may be creamed by the addition of flour and milk.

Oyster Soup.—Rub together two tablespoonfuls each of flour and butter, and add one pint of hot milk; then drain and add gradually the liquor from one pint of oysters; and when the mixture is brought to a boil add the oysters, which must have been well washed. Cook all together until the oysters begin to grow plump and the edges begin to curl. After seasoning, this must be served instantly with crackers.

Oysters possess a slight nutritive value, and all the nourishment is easily available to a weak digestion, especially if the tough adductor muscle be removed. An irritable stomach will often welcome oysters or clams attractively prepared, and benefit by the nourishment. Clams are much tougher than oysters, and should be given to an invalid only as broth or liquor. Whole raw oysters are frequently served to convalescents.

Clam Broth.—Take as many large clams as desired, and thoroughly wash and scrub them; put in a kettle with a very small amount of water in proportion, and cook until the shells begin to open. Then strain the liquor off through cheese-cloth, season and dilute if desired. This may be hot, cold or frozen; it may be kept in this fundamental form for a long time if cooked, and may be varied by flavorings of herbs, or reinforced by pulverized cracker crumbs. By the addition of milk and flour, cream of clams is obtained. The plain broth is very valuable in nausea.

Egg-nog.—This food is made in a number of ways; it is very frequently a staple for invalids of long standing, and a fagging interest in it may be revived by a slight variation. The white and yolk of the egg may be beaten separately or together; the flavoring may be wine, whisky, brandy or, if alcohols are not desirable, vanilla or some fruit-juices; usually a little nutmeg is added, and always salt where eggs are used. The milk may be hot or cold, or one-half milk and hot water may be used. A good

standard recipe is as follows: one egg, two-thirds cup of milk, one tablespoonful of sugar, two tablespoonfuls of flavoring if it is a wine, one tablespoonful if brandy or whisky, one teaspoonful if vanilla. If the white of the egg is beaten the patient will find it more convenient to drink with a glass tube or straw.

Bonnyclabber.—Skimmed milk which has become thick by standing. It is served in the same dish it has stood in, with whipped cream or white of egg.

Wine Whey.—Scald one cup of milk, add one cup of sherry or port wine and stand five minutes. Strain and sweeten if desired. Whey can also be separated by lemon-juice, vinegar or rennet.

Junket Custard.—Heat lukewarm (not hot) one cup of milk; add two tablespoonfuls of sugar and one teaspoonful of brandy, or one-fourth teaspoonful of vanilla. To this add one-fourth junket tablet dissolved in one teaspoonful of cold water; turn into small molds and cool. This may also be frozen, if packed in a small tin box and surrounded with ice and salt.

Egg Custard.—Mix one-half cup of milk, one tablespoonful of sugar and one egg, beaten whole. Put into cups and bake in water.

Caramel Custard.—To the above add enough browned sugar to give color and caramel taste.

Chocolate Custard.—Add melted chocolate to regular egg-custard recipe.

Bread Jelly.—Toast brown the inside of five slices of stale bread and soak in two quarts of boiling water with a few slices of lemon; later let this boil to a jelly; strain, sweeten and eat it cold. A little gelatin may be added, but is not necessary.

Chicken Jelly.—This is prepared like chicken broth, but the stock is allowed to solidify. If poured into attractive molds the jelly will be pleasing to the patient; or it may be cut into cubes and used as a garnish to other things. Fresh chicken meat may be molded with the jelly if the patient can eat it.

Wine Jelly.—Take one-half box of gelatin (or two tablespoonfuls of granulated), soak 20 minutes in one-half cup of cold water; dissolve this in one and two-thirds cups boiling water and add one cup of sugar, one cup of sherry or Madeira, one-third cup of orange-juice and three tablespoonfuls of lemon-juice. Strain, mold and chill.

Lemon Jelly.—Make this with one-half box of gelatin dissolved in one-half cup of water, dissolved in two and one-half cups of boiling water; strain and add one cup of sugar and one-half cup of lemon-juice.

Orange Jelly.—Same as wine jelly, using one and one-half cups of orange-juice and three tablespoonfuls of lemon-juice.

Cider Jelly.—Use cider, dilute or not, in proportion of three and one-half cups of liquid to one-half box of gelatin or two tablespoonfuls.

Gelatins in combination with other things are beneficial to ill persons, though by no means highly nutritious; a very distinct flavor is necessary to secure palatability, or even digestibility.

Indian-meal Mush.—Mix one-half cup of Indian meal with one-half teaspoonful of salt and three-fourths cup of milk; stir this into one cup of boiling water and cook three hours in double boiler. Serve with sugar and cream.

Rye-meal Mush.— Mix one-half cup of rye meal with one-half teaspoonful of salt and one-half cup of cold water; add to one and one-fourth cups of boiling water; boil five minutes; then cook in double boiler. Serve with maple syrup if possible or with sugar and cream.

Egyptian Porridge.— Use three tablespoonfuls of lentil flour, mix with salt and one pint of water to a paste. Boil 10 minutes, constantly stirring. This is nutritive and agreeable.

Mushes.— Of all the other ordinary cereals mushes may be similarly prepared, the special precaution being to cook the cereal a sufficient length of time, always one hour, and longer if the heat is not great. For a weak digestion especially the starch in these preparations must be made soluble and directly available, and the only way of accomplishing this is by thorough cooking. Most of the ordinary cream soups are possible to the invalid; precaution must be taken, however, to see that they are especially prepared in order that the butter and flour used for thickening this class of soups be not cooked together; for when this fat and starch are mixed it is well-nigh impossible for an impaired digestion to deal with them. When possible, it is well also to have the milk merely heated and not boiled, as boiling detracts from the beneficial results of milk and tends to constipation. The simpler soups in this class, for which recipes can be found in any modern cookbook, are advisable: such as rice soup, potato soup, black or white bean soup, pea soup, creams of celery, corn or asparagus, tapioca soup, bread soup. If well prepared, these soups would be included under semi-solids, as they must be eaten, not drunk, and contain a good deal of nourishment.

Toast.— This must be made of stale bread from which crust has been removed, and slowly browned over a flame until thoroughly crisp.

Dextrinized Bread.— Stale bread heated in the oven until it has become dark brown.

Torrefied Bread.— Prepared in the same manner as dextrinized, but with greater heat and for a longer time.

Pulled Bread.— Remove all crust from a loaf of 'loose-textured' bread; from the inside portion form strips with forks or fingers, breaking or pressing as little as possible. Put upon a papered pan and bake until of a golden brown color and crisp. Serve with whipped cream.

Care must be taken with bread for invalids that it be thoroughly baked in loaves small enough to warrant complete killing of all yeast. Freshly baked bread is never to be given to a person with even slightly impaired digestion. A loaf should not be cut for 24 hours after baking. Very frequently in disease the stomach and small intestine cannot hold or digest food. In such cases the introduction of food into the bowel through the rectum, by means of a Davidson syringe, is necessary or advisable. Some of the formulæ enemata more commonly used are here given:

Nutritive Enemata.— When it is impossible for the patient to take food as ordinarily, a nutritive enema will be ordered. Special formulæ will probably be given by the physician, but a safe rule is to add to one pint of the foundation liquid (which is usually milk, because of its simple, convenient and un irritating character, though only about one-third absorbed; but may be beef-tea, mild gruel or

eggs) one tablespoonful of liquor pancreaticus and 30 grains of bicarbonate of soda. Administer at once after preparation is added.

Special formulæ are given, as they are frequently ordered by name:

Peptone and milk enema: 60 grams peptone, 250 c.c. milk.

Egg and milk: three eggs, three grams salt, 250 c.c. milk.

Sugar and milk: 60 grams grape-sugar, 250 c.c. milk.

Boas' enema: 250 c.c. milk, yolks of two eggs, pinch of salt, 15 c.c. red wine, 15 grams starch or arrowroot.

Riegel's enema: 250 c.c. milk, all of two or three eggs, two or three pinches of salt, 30 c.c. red wine.

Tournier's enema: 140 to 150 c.c. beef-tea or raw beef juice, yolks of six eggs, two salt-spoonfuls salt, 20 to 40 c.c. red wine.

Wine may be omitted from any of these formulæ.

Leube's Pancreas Enema: Mix 50 grams of pancreas, 150 grams lean meat and 30 grams of fat, all chopped as finely as possible in 150 c.c. lukewarm water. This is an attempt to imitate natural intestinal digestion, is claimed to be un irritating as well as nourishing and is retained well.

Enemata should always be given at body temperature, in bulk not to exceed four to five ounces. They must be introduced as high as possible, and be given very slowly; the patient must lie perfectly quiet for at least an hour after injection. During 24 hours three or four nutritive enemata and one cleansing enema are sufficient for a patient. Trial is often necessary with various formulæ before one is found that can be retained. A very small quantity of opium added may help to retain them, but is not advisable without a physician's special orders.

SMITH ELY JELLIFFE, M.D.,
Formerly Instructor in Therapeutics, Columbia University, Medical Department.

SICK MAN OF EUROPE. The, a term applied to Turkey in 1854, by the Tsar Nicholas, in a conversation with Sir Hamilton Seymour, the British ambassador at Saint Petersburg. The tsar intimated his opinion that Turkey was sick and dying. He therefore proposed that, to avoid a European war when the demise took place, Russia and Great Britain should come at once to a private arrangement as to the disposal of the Sick Man's effects. As France was ignored in the arrangement, there was some doubt as to the good faith of the tsar. The British government rejected the proposal, intimated its belief in the recovery of the Sick Man, and soon after fought by his side in the Crimean War.

SICKINGEN, zik'ing-ën, Franz von, German soldier and Protestant reformer: b. near Kreuznach, 2 March 1481; d. 7 May 1523. From early youth he devoted himself to the military life. The protection of the oppressed was his chief occupation. He assisted many a creditor in procuring what was due him from a powerful debtor. He was the enemy of tyranny, and endeavored on every occasion to repress the despotism of princes and the arrogance of the priests. Without being a scholar he loved science and protected men of learning

(for instance Reuchlin, whom he defended against the monks of Cologne); and in his castle at Ebernburg many persecuted scholars found a safe asylum. He was a friend of the Reformation, and contributed greatly to extend it in the countries which bordered on the Rhine. At last he engaged in a quarrel with Treves, the palatinate, and Hesse, which drew upon him the ban of the empire. He died soon after the surrender of Neustall, one of his castles, having previously received a severe injury from a fall during a sally. Consult the study by Ulmann (1872).

SICKLES, sĭk'lz, Daniel Edgar, American soldier: b. New York, 20 Oct. 1823; d. there, 3 May 1914. He was educated at the University of the City of New York, but did not graduate. He began to learn the printer's trade, then turned to the study of law, and was admitted to the bar in 1846. In 1847 he entered the legislature as a Democrat, and in 1853 was appointed corporation counsel for New York. In that year he accompanied James Buchanan to England as secretary of legation. Returning to America in 1855 he was elected to the New York State senate, and two years later became a member of Congress serving until 1861. He was tried for the murder of Philip Barton Key, whom he shot on the street in Washington, D. C., 27 Feb. 1859, on account of a guilty intimacy with Sickles' wife, and was acquitted, the defense being temporary aberration of mind — the first case in which that plea was set up. Key was United States Attorney for the District of Columbia and a son of the author of the 'Star-Spangled Banner.' At the beginning of the Civil War Sickles raised in New York the Excelsior Brigade of the United States volunteers, and was commissioned colonel of one of its regiments the 70th New York. In September 1861 he was nominated brigadier-general of volunteers. He participated in the Peninsula campaign (q.v.) and the battle of Antietam, under McClellan, and at Fredericksburg commanded a division. Having been made major-general of volunteers in November 1862 he was given command of the Third corps in February 1863, and bore a distinguished part in the battles of Chancellorsville and Gettysburg (qq.v.) At Chancellorsville he cut off the enemy's ammunition train, and by rallying the retreating artillery gained the first success of the day. At Gettysburg his corps withstood the Confederate assault on the Federal left, at the Peach Orchard, and Sickles lost a leg in the encounter. He continued in active service until 1865, when he was sent on a private mission to Colombia and other South American countries. He joined the regular army in 1866, and on 2 March 1867 was brevetted brigadier-general for bravery at Fredericksburg and major-general for gallant and meritorious service at Gettysburg. For the latter battle, also, he was awarded the Congressional Medal of Honor 30 years later, 30 Oct. 1897. During the early years of the reconstruction of the South he was in command of the military district of the Carolinas, but in 1867 President Johnson relieved him of his command and offered him the mission to the Netherlands, which he declined. On 14 April 1869 he was placed on the retired list of the army with the rank of major-general. From 1869 to 1873 he was United States Minister to

Spain, where he had diplomatic management of the *Virginus* case; in 1890 was sheriff of New York County, N. Y.; and in 1892 was again elected to Congress, where he served till 1897. For one year he was president of the New York State Board of Civil Service Commissioners (1888-89). When the New York Monuments Commission was founded in 1886, Sickles became its chairman, an office he held for 26 years until, in December 1912, he was deposed on account of a shortage of \$27,000. In 1902 he was elected commander of the Medal of Honor Legion. So long ago as 1879 the French Republic had decorated him with the Legion of Honor. After the death of his wife Sickles married again in Spain, 1871.

SICOTTE, sē-kōt', Louis Victor, Canadian statesman: b. Saint Famille, Quebec, 7 Nov. 1812; d. 1889. He was called to the bar in 1838, later establishing himself in practice at Saint Hyacinthe and becoming a leader of the bar. He was a member of the Canadian Parliament in 1852-63; was judge of the Superior Court in 1863-87; and in 1862-63 was Attorney-General for Lower Canada in the Macdonald-Sicotte administration. He was a leader of the moderate Reformers.

SICYON, sish'i-on, Greece, one of the oldest, most celebrated and handsome of the ancient cities of the country on the Asopus River, about two miles from its port on the Gulf of Corinth. The city is said to have been founded before 2000 B.C. The site is now occupied by the village of Vasilikon. With adjacent territory the city formed the small state of Sicyonia; at an early period it was ruled by princes, but later became a republic (252 B.C.), and joined the Achæan league formed by Aratus, finally coming under the domination of Rome. Sicyon was especially celebrated for its schools of sculpture and painting. It gave its name to a school of art which numbered among its disciples Polycletes and Apelles, both natives of Sicyon. The ancient theatre has been excavated by the American Archæological School at Athens.

SIDDHARTHA ("he who has accomplished his aim"), the name given to Prince Gautama Buddha (see BUDDHISM) at his birth in the 7th century B.C. This was his individual name; Gautama, that of his tribe — settlers in Gakja or Gauta, a region situated between the plain of the Ganges and the Himalaya Mountains. Buddha was a title of later origin. Consult Arnold, E., 'The Light of Asia' (1879).

SIDDONS, sĭd'onz, Sarah Kemble, English actress: b. Brecon, South Wales, 5 July 1755; d. London, 8 June 1831. (See KEMBLE ROGER). She appeared early on the provincial stage won some local fame at Wolverhampton and Cheltenham, and was secured by Garrick for Drury Lane, where her failure was distinct. After this she acted successively at Birmingham, Manchester, York and Bath, where she opened in her great part of Lady Macbeth, increasing her reputation to such a degree that she was again engaged at Drury Lane. Her reappearance in London took place on 10 Oct. 1782, in the character of Isabella in the play of that name, being Garrick's adaptation of Southerne's 'Fatal Marriage.' Her success was complete. The public were astonished by her powers, and she

was universally acknowledged to be the first tragic actress of the English stage. She subsequently visited Dublin and Edinburgh with equal applause. She appeared as Lady Macbeth for the first time in London on 2 Feb. 1785, and in that character was declared perfect by competent critics. Christopher North, Hazlitt, Leigh Hunt, Lord Erskine and many others agree in praise of her performances, which were at their best in tragedy, and belonged to the fine old declamatory (sometimes called the "Kemble") school. In solemn majesty, pathos and minute finish she surpassed Rachel (q.v.). For 30 years she continued to astonish and enchant the lovers of the drama, and having acquired an ample fortune, and been portrayed by Reynolds as the 'Tragic Muse,' took her leave of the stage in 1812, before an audience which melted into tears on the occasion. She, however, performed subsequently at benefits and gave privately Shakespearian readings. She was seen as Rosalind, Ophelia and Desdemona, with great success; and as Catharine in 'Henry VIII,' discovered a part nearly as well suited to her as that of Lady Macbeth. Consult the 'Lives' by Campbell (1834); Kennard (1886); Fitzgerald, P., 'Account of the Kembles Family' (2 vols., London 1871); Matthews and Hutton, 'Actors and Actresses of Great Britain and the United States' (New York 1886).

SIDE-SADDLE FLOWER. See **SABBA-CENIA**.

SIDEREAL CLOCK, a clock regulated to measure sidereal time, reckoned by sidereal days of 23 hours, 56 minutes, 4 seconds mean solar time, which are measured by the interval between two successive passages of any fixed star over the same meridian, and divided into 24 sidereal hours.

SIDEREAL SYSTEM. See **STARS**.

SIDEREAL TIME, time measured by the apparent motion of the stars. A sidereal day is the time from the passage of a star across the meridian till its next passage. If the stars are supposed to be absolutely fixed and at an infinite distance, a sidereal day is exactly the period of the revolution of the earth on its axis; the effects of the motions of the stars and the motion of the earth in its orbit are insensible. A sidereal day is the most constant unit of time which we possess; but it appears that it is increasing in duration very slowly. The length of a sidereal day is 23 hours 56 minutes 4.092 seconds. A sidereal year is the exact period of the revolution of the earth round the sun.

SIDERITE, a mineral composed of carbonate of iron, and when pure crystallizing in the rhombohedral system. It then is also known as spathic iron. Another name is chalybite. The faces of the rhombohedral crystals are commonly curved, and there is a perfect rhombohedral cleavage. Besides this it occurs in botryoidal and in globular form, with a more or less fibrous internal structure. Again it is massive, or coarsely or finely granular.

The hardness is 3.5 to 4; the specific gravity 3.7 to 3.9. It has a vitreous lustre, and is often more or less pearly. The color varies from ash-gray, through yellowish-gray, greenish-gray, to brown and brownish-red; some-

times it is white. The streak is white. It is commonly translucent or subtranslucent.

In composition it is: FeCO_3 . Part of the iron is usually replaced by manganese, and often by magnesium or calcium.

The principal varieties are (a) crystallized, (b) concretionary, in globular form, with fibrous structure, (c) granular, (d) massive, (e) oolitic, and (f) earthy, with a large admixture of clay. This latter variety constitutes a large part of the clay in stones of the coal formations.

In the United States siderite occurs at Plymouth, Vt.; Sterling, Mass.; Roxbury, Conn.; Antwerp, Jefferson County, N. Y., and at the Rossie Iron Mines, Saint Lawrence County, N. Y., and in North Carolina. Also in Pennsylvania, Ohio and other States, chiefly as clay iron stones in the Coal measures.

SIDEWINDER, a local name in Arizona for the horned rattlesnake (*Crotalus cornutus*), referring to its sidewise method of progression. See **RATTLESNAKE**.

SIDI-BEL-ABBES, sé'dé-bél-áb-bás', Algeria, a town in the department of Oran, lies 38 miles south of the town of Oran, on the Mekerra River. It is a modern walled town, and occupies a height rising from a fertile healthy and populous plain. Numerous fountains adorn the town. Esparto grass grows here profusely. There is some trade in hides, alfa, cattle, etc. Pop. 25,000.

SIDIS, sí'dis, Boris, American psychologist and psychopathologist; b. government of Kieff, Russia, 12 Oct. 1867. He came to the United States in 1887, was graduated at Harvard University in 1894 and later pursued post-graduate studies there, taking his Ph.D. in 1897, his M.D. in 1908. He was associate in psychology and psychopathology at the Pathological Institute of the New York State hospitals in 1896-1901; in 1901-04 was director of the psychopathological hospital and laboratory of the New York Infirmary for Women and Children; and subsequently practised medicine at Boston and at Brookline, Mass. He is also medical director of the Sidis Psychotherapeutic Institute at Portsmouth, N. H. Author of 'The Psychology of Suggestion' (1898); 'Psychopathological Researches in Mental Disassociations' (1902); 'Experimental Study of Sleep' (1909); 'Philistine and Genius' (1911); 'The Psychology of Laughter' (1913); 'The Foundations of Normal and Abnormal Psychology' (1914); 'Caesation and Treatment of Psychopathic Diseases' (1916), etc.

SIDNEY, sí'dní, Algernon, English statesman and republican, son of the 2d earl of Leicester; b. Penshurst, Kent, 1622; d. London, 7 Dec. 1682. He was educated under the supervision of his father, whom he accompanied on his embassies to Denmark and to France. He served in 1642 as captain of a troop of horse in Ireland, and in the civil war espoused the cause of Parliament. He was promoted colonel of horse in 1645, was returned to the Long Parliament in 1646 as member for Cardiff, and in 1647 was appointed lieutenant-general of the horse in Ireland and governor of Dublin, but was soon superseded and in 1648-50 was governor of Dover. In 1649 he was appointed one of the commissioners for the trial of Charles I,

but while he attended three of the preliminary meetings he was not present at the trial and did not sign the warrant. He is frequently quoted as approving the measure, and later admitted his justification of it, but his plan, though not exactly clear, seems to have been the deposition of the king by an agreement of both houses. He incurred the enmity of Cromwell by his opposition, and during the first three years of the Commonwealth he stood aloof. In 1652, however, he was elected a member of the council of state and attended 82 meetings in the four and a half months before the council was dissolved by Cromwell, being particularly occupied with foreign affairs. He protested against the Protectorate of Cromwell and afterward held aloof from public affairs until the restoration of the Long Parliament by the army in 1659, when he resumed his place and was again appointed to the council of state. In that year he was sent as a commissioner to negotiate a peace between Sweden and Denmark, and while engaged in this mission the Restoration took place. Aware that his part in the civil troubles could but bring him into disfavor with the royal party, he remained in exile until 1677, when he was given leave to return to settle his private affairs. The excitement attending the exclusion struggle drew Sidney again into politics and he made several unsuccessful attempts to enter Parliament, although outside of that body he wielded a considerable influence. He vindicated himself from an accusation of being the head of a great non-conformist plot soon after the discovery of the "popish plot," but his private letters, though written with great caution, show a deep sympathy for the non-conformists and the Scots as well as an invincible hatred for bishops and Roman Catholics. He was engaged in an intrigue with the French Ambassador through whom he endeavored to persuade Louis XIV to aid the establishment of a republic in England and evidently hoped to gain at least the maintenance of the rights of Parliament. He undoubtedly received pecuniary aid to the extent of 1,000 guineas through the French Ambassador, though he evidently used the money for public purposes. He seems to have taken no part in the armed resistance of Shaftesbury in 1682, but in 1683 he formed one of the "council of six" in the "Ryehouse Plot" to organize an insurrection among the Scottish malcontents. He was arrested after its discovery and sent to the Tower, charged with three overt acts of treason, consisting of consultations amounting to a conspiracy to levy war against the king; invitation to certain Scots to co-operate with his plans; and of having written a treasonable libel concerning the lawfulness of deposing kings. The only witness against him on the first charge was the infamous Lord Howard, the second charge was proven unfounded, and regarding the third though his authorship of the incriminating paper was undoubted, yet there was nothing to show that it was intended for publication. The law demanded two witnesses for high treason. The notorious Judge Jeffreys accepted the paper as the second witness required by the law, and on this faulty evidence Sidney was sentenced to death. After a fruitless petition to the king he was executed on Tower Hill. His 'Discourses on Government' exhibit great acuteness, are

forcibly written, and contain valuable historical information. They were first printed in 1698, and have been reprinted in 1740, 1751 and 1772. Consult Ewald, A. C., 'Life and Times of Algernon Sidney' (1873); Meadley, G. W., 'Memoirs of Algernon Sidney' (1813); Van Santvoord, G. V., 'Life of Algernon Sidney' (New York 1851); 'Dictionary of National Biography' (London 1888).

SIDNEY, SIR Philip, English soldier, statesman and poet: b. Penshurst, Kent, 30 Nov. 1554; d. Arnhem, Netherlands, 17 Oct. 1586. After studying at Oxford and Cambridge he set off on his travels at 18, visited France, Hungary and Italy. Returning through Germany and Flanders, he arrived in England in 1575. He became a favorite with Queen Elizabeth, who in 1576 sent him on an embassy to Germany. He had a quarrel with the Earl of Oxford, but the queen interposed to prevent a duel from taking place. Sidney, displeased at the issue of the affair, then retired to Wilton in Wiltshire, 1580, and amused himself with the composition of his celebrated pastoral romance, 'Arcadia.' He married Frances, daughter of Sir Francis Walsingham, in 1583. That same year he was knighted. About this time he projected with Sir Francis Drake an expedition against the Spaniards in America, and he had gone to Plymouth to embark on the undertaking, when an express mandate from Elizabeth recalled him to court. Her influence also was exerted to prevent him from being elected king of Poland, "refusing," as Camden says, "to further his advancement out of fear that she should lose the jewel of her times." He was subsequently appointed governor of Flushing, and general of the cavalry under his uncle Dudley, Earl of Leicester, who commanded the forces sent to assist the Dutch against the Spaniards. On 22 Sept. 1586, being at the head of a detachment of the English troops, he fell in with a convoy of the enemy marching toward Zutphen. In the rash charge of 500 against 3,000, Sidney received a shot in his thigh, which shattered the bone. An incident that occurred as he was being borne off the field illustrates his character. It is thus recorded by Lord Brooke (Fulke Greville) his biographer: "In which sad progress, passing along by the rest of the army where his uncle the general was, and being thirsty with excess of bleeding, he called for some drink, which was presently brought him; but as he was putting the bottle to his mouth he saw a poor soldier carried along, who had eaten his last at the same feast, ghastly casting up his eyes at the bottle. Which Sir Philip perceiving, took it from his head before he drank, and delivered it to the poor man with these words: 'Thy necessity is greater than mine.' His body was carried to England, and after lying several days in state was buried in Old Saint Paul's Cathedral. His brief career, which to many may seem not to justify his great reputation, nevertheless made a powerful impression on English patriotism. So universally was he esteemed that a general mourning for him was observed throughout the whole country. For a month no gentleman of quality cared to appear in London without mourning garb. He was panegyricized by his contemporaries, and the universities issued three volumes of elegies on

his death. "He adorned the paths of love, war, patriotism, religion, all that led through the wide fields of his beautiful, practical chivalry, with the roses and lilies of fragrant, flowery verse." Edmund Goss. His works, besides the 'Arcadia,' consist of the 'Apologie for Poetrie,' later changed to 'Defense of Poesie'; 'Astrophel and Stella'; a collection entitled 'Songs and Sonnets, and other poetical pieces.' None of these was published in his lifetime his great contemporary fame being based on the reports of those to whom his manuscripts were communicated. He is best known for his 'Arcadia,' one of the earliest specimens of the heroic romance, written in mingled prose and verse, the latter exhibiting various attempts to naturalize the measures of Roman poetry, and for the 'Astrophel and Stella' cycle of 108 sonnets and 11 songs.

SIDNEY LUSKA. See HARLAND, HENRY.

SIDNEY, Ohio, city, county-seat of Shelby County, on the Miami River, the Miami and Erie Canal, and on the Cincinnati, Hamilton and Dayton, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 40 miles north of Dayton and 65 miles west by north of Columbus. It is in an agricultural region, and has considerable manufacturing interests. The educational institutions are a high school, public and parish elementary schools, two private schools, and a public library. Pop. (1910) 6,607.

SIDNEY SUSSEX COLLEGE, Cambridge, England, was founded in 1596 under the will of Lady Frances Sidney, countess-dowager of Sussex, aunt to Sir Philip Sidney. The charter was granted in 1594 by Queen Elizabeth to Henry Earl of Kent and Sir John Harrington, the executors. The present society consists of a Master, 11 Fellows and 36 scholars. There are 10 fellowships, 24 scholarships, and a number of exhibitions. The scholarships and exhibitions connected with the college are: 30 scholarships varying in value from \$150 to \$250 a year and five exhibitions, besides several prizes. The college was erected on the site of an ancient Franciscan convent. It consists of two courts much defaced by modern alterations.

Oliver Cromwell and Thomas Fuller were members of this college. There are eight church livings in the patronage of the college.

SIDON, sī'dōn, (Heb. *Zidon*; Arabian *Saida*), anciently a city of Phœnicia (q.v.), on the Syrian coast of the Mediterranean, lies midway between Tyre and Beirut. It is surrounded by a wall with two gates. Its chief interest is historical. It was a wealthy city, with an excellent harbor and much commercial enterprise, being specially noted for purple dyes. It was watered by the streams of Lebanon, and many allusions to it are found in secular and Scriptural writings. Sidon was referred to as 'The first-born of Canaan'; Homer alludes to the ingenious Sidonians and their artistic handiwork. The town was famous for its manufactures of glass, linen, purple dye and perfumes. The Sidonians had their own monarch, but it was once subject to Tyre, and later to the Persians. It passed through many vicissitudes, finally passing over to the Moslems (1291). In the 17th and 18th centuries it became the seat of French commerce. It is now called Saidi. Interesting sarcophagi have been found here (now in Constantinople). The present town was stormed by the Allies under Napier in 1840. Pop. 15,000; of whom 10,000 are Mohammedans. See SYRIA.

SIDRA, Gulf of (ancient SYRTIS MAJOR), Tripoli, a wide gulf of the Mediterranean Sea between the main portion of Tripoli and the plateau of Barca. Its coast-line of over 500 miles is beset with shoals and sand-banks, offering no harbor except Bengazi, at the extreme eastern end. See SYRTIS.

SIEBENBERGE, zē'bēn-gē-bēr'gē (Seven Mountains), Germany, a small chain of mountains near the Rhine, in Rhenish Prussia, 20 miles above Cologne. Above the main range rise seven lofty summits, whence the name. These rugged heights are all crowned with ruins of ancient lordly castles of the 12th century. Ölberg is the highest peak (1,522 feet); while the Drachenfels (q.v.) is the more interesting. Cologne Cathedral was built from stones quarried in these Rhenish Mountains. Some of the peaks are ascended by specially built railways. The scenery is romantic and interesting.

SIEBERT, sē'bērt, Wilbur Henry, American educator: b. Columbus, Ohio, 30 Aug. 1860. He was graduated at Ohio State University in 1888, from Harvard in 1889 and received his A.M. at Harvard in 1890; studied in Germany in 1890-91, was associate professor of European history at the Ohio State University in 1898-1902, since which time he has been professor of that branch. He was secretary of the University Faculty from 1902 to 1906, and acting dean of the College of Arts, Philosophy and Science during 1907-08; also served as lecturer in history at Ohio Wesleyan University during the same year. He traveled in Europe in 1909-10. Is a member of numerous learned and other societies. He has published 'The Underground Railroad from Slavery to Freedom' (1898-99); 'The Government of Ohio' (1903); numerous papers relating to the dispersion of the American Loyalists, and articles on some other subjects, including a 'Report on Collections of

Material in English and European History in the Libraries of the United States.'

SIEBOLD, zē'bōlt, Karl Theodor Ernst von, German physiologist and zoologist; b. Würzburg, 16 Feb. 1804; d. Munich, 7 April 1885. He studied at Göttingen and Berlin; in 1840 was made professor of physiology at Erlangen, in 1845 at Freiburg and in 1850 at Breslau. In 1853 he was made professor of physiology and comparative anatomy at Munich, where to his chair were later added duties as professor of zoology and director of the zoological and zootomical cabinet. His contributions to scientific research are suggested by the titles of his monographs: 'Observationes de Salamandris et Tritonibus' (1828); 'Lehrbuch der vergleichenden Anatomie der wirbellosen Tiere' (Eng. trans., 'Manual of Comparative Anatomy of the Invertebrates,' 1848); 'Ueber die Band- und Blasenwürmer' (1854); 'Wahre Parthenogenesis bei Schmetterlingen und Bienen' (1856); 'Beiträge zur Parthenogenesis der Arthropoden' (1871). Consult Hertwig's memorial address 'Gedächtnissrede' (1886). In 1849 he assisted to found the *Zeitschrift für wissenschaftliche Zoologie*.

SIEBOLD, Philipp Franz von, German physician and traveler; b. Würzburg, 1796; d. Munich, 1866. He was a son of a professor of medicine at Würzburg, and there received his education. In 1822 he removed to the Netherlands and became sanitary officer at Batavia, Dutch East Indies. He accompanied the Dutch embassy to Japan in 1823 and remained there until 1830. He made a second visit in 1859-62. His books upon the Japanese, their language, the flora and fauna of the country, etc., did much to make that country known to the world. He published 'Nippon, Archiv zur Beschreibung von Japan' (1832); 'Fauna japonica' (1833); 'Flora japonica' (1835); 'Bibliotheca Japonica' (1833-41); 'Catalogus librorum japonicorum' (1845); 'Isagoge in bibliothecam japonicam' (1841); 'Epitome linguæ japonicæ' (1826-53); 'Floræ japonicæ familiæ naturales' (1851).

SIEGE. Three important elements are necessary to insure the success of a siege. First, the force of the besiegers must be sufficient to overcome the besieged in actual combat, man to man. If this is not the case the besieged, by a sortie, might destroy the opposing works, and drive away the besiegers. The second element is, that the place must be invested; so that no provisions, reinforcements, or other aliment of war can enter. The third element is, that the besiegers be undisturbed from without. For this it is essential that there shall not be a hostile army in the neighborhood; or, if there be, that the operations of the besiegers be protected by a covering army able to cope with the enemy's force in the field. The ancients executed gigantic works to produce these effects. To complete the investment, they built a high and strong wall around the whole fortress; and to render themselves secure from without, they built a similar wall facing outwards, beyond their own position. The first was circumvallation, the second contravallation. It was thus that Cæsar fortified himself while besieging Alexia, and maintained 60,000 men within his ring. In modern war-

fare, it is considered preferable to establish strong posts here and there round the place, and merely sentries and vedettes between.

The first step toward the reduction of a fortress is to cut off communication of the occupants with the outside world. This is done by a rapid movement of a relatively small force followed by reinforcements sufficient to hold a line entirely around the place and beyond the range of its artillery. This line is called the "Line of Investment," and the belt of territory immediately outside of it occupied by the investment force is called the "zone of investment." Whether this line must be occupied continuously will depend upon its nature. As much must be actually occupied or commanded as could be used by the besieged for exit or entrance. The line of investment is divided into sections, preferably so chosen that a unit of command can be assigned to each.

Troops assigned to a section of the zone of investment begin at once to reconnoiter it and put it in the best possible state of defense. Artificial or accidental features are prepared and strengthened, intrenchments thrown up where required, communications made and improved through and between sections and telegraph and telephone lines established around the zone and to headquarters. Every means must be utilized to gain knowledge of the ground inside the zone. The time which must elapse before the siege material can be brought up will permit a great deal of such work to be done.

The real attack or systematic approach is pushed inward from a few points only of the zone of investment, usually one or two. The side on which these approaches are made is determined by the following conditions: (1) The best communication with the base; (2) The best terrain for battery positions and approaches under natural cover; (3) The most favorable ground for construction and operation of siege railways; (4) The easiest digging; (5) The most important consequences of success.

The first condition is usually controlling, unless one of the others is prohibitory. If the zone of investment is favorable and ample siege railway equipment is available, the attack may be conducted from points somewhat removed from the main terminus of the supply line. The main defensive line of an important fortress consists of a series of detached forts. To breach such a line one fort at least, more often two, must be taken, and during the operation the fire of the one on each side must be kept down. If two forts are to be reduced, the siege consists of artillery work against four and trench work against the middle two of these. When the front of attack is decided the main engineer park is located out of reach of the defenders' artillery, convenient to the front selected and to the main supply line, and connected with the latter by good communications. Here is assembled all the siege material pertaining to engineering operations as fast as it arrives, to be sorted and arranged in convenient shape for selection and forwarding to the front as required. Sites for the main siege batteries are next selected, at moderately long range from the forts, 2,500 to 4,000 yards, and for intermediate parks near them to con-

tain materials for the construction, repair and supply of batteries. These sites are connected by a belt railroad immediately in their rear, and the belt line is connected with the main park at one or more places.

The complete investing force must be heavily reinforced, ordinarily about doubled, before siege operations on any considerable scale are undertaken. The additional force is concentrated along the front of attack, mainly toward its centre. This and the investing force along the front of operations are sometimes called siege troops, and the remainder of the investing force distinguished as investing troops. The siege force should consist of infantry, engineers and artillery in the proportion approximately of 83 per cent, 5 per cent and 12 per cent, respectively, with the proper contingent of the signal and hospital corps and supernumerary engineers and ordnance officers. The total attacking force ranges from two and one-half to four times the strength of the garrison. The siege artillery is disposed in batteries of four pieces or less, dispersed as much as concentration of fire will permit, and sited when possible on the reverse slopes of ridges or hills or behind timber, and employs indirect fire almost exclusively. Though batteries are invisible, the high-angle fire of the defense reaches them, as the enemy's artillery systematically searches all reverse slopes within range, and the effect of shells must be localized by artificial cover. An emplacement for each gun is best.

First Parallel.—When the siege batteries have brought the artillery fire of the defense under control, the first attempt to gain ground to the front is made by opening a trench generally parallel to the line of investment and, if possible, within 1,200 yards of the enemy's main line. During the day the outposts are advanced to or beyond the proposed line, to permit it to be reconnoitered and its bearings noted. At night the attack is pushed more strongly and the enemy driven in as far as possible for the greater safety of the working parties. As soon as it is dark enough for concealment the tracing is begun. Each party consists of one engineer officer, one non-commissioned officer and a private for each 50 yards of line to be traced. Approaches or zigzag trenches must be traced and dug on the same night with the first parallel, connecting it with cover in the rear. There should be at least three such approaches—at right, left and centre. The tracing of approaches for simultaneous digging differs in detail but little from that of the parallel. It is more difficult because the line is broken and greater accuracy is required. The digging of approaches under fire differs from ordinary trench work in that it is done progressively from one end and with the men reasonably protected from fire while doing it. Tracing is dispensed with. Approaches are usually called "saps," the operation of digging them "sapping," and the skilled men "sappers." The end at which digging is in progress is called the saphead.

Single Sap.—A party of one non-commissioned officer and eight sappers in two reliefs work at the saphead. The two leading sappers, Nos. 1 and 2, excavate a trench four and one-half feet deep and just wide enough to work in, throwing the earth to the front of the exposed

side. They are protected in front, or on the end of the trench, by a pile of half-filled sand bags, 50 or 60 in number, piled so as to make a parapet two feet high. The sand bags should be smeared with mud so as to show the color of the soil. No. 1, kneeling or crouching, undercuts the end breast a few inches and brings down the earth. He steps back and No. 2 takes his place and shovels the loose earth out. No. 1 returns, throws forward as many sand bags as may be necessary to gain ground, using a fork or rolling them over with his hands. He then undercuts again and the operation is repeated. Nos. 3 and 4 widen the trench two feet and raise the parapet, also forming a berm 12 to 13 inches wide. The rate of advance of a sap is only two to four feet an hour. When half a yard has been gained, Nos. 1 and 2 exchange places, and when a yard is gained the other relief comes in. At each change of reliefs the men who were Nos. 3 and 4 on the last tour take 1 and 2. Casualties are made up from the waiting relief. Generally, unless reduced to less than four men, the detachment must work without reinforcement until the regular change of trench relief. A working party of infantry, 25 feet in rear of the sappers, widens the trench to 10 feet.

Double Sap.—Two parties work parallel to each other, Nos. 1 and 2 leaving a four-foot tongue between them, which is taken out by Nos. 3 and 4. No widening party is required. To prevent enfilade the direction of the trench is changed at right angles as soon as the plunging fire becomes too annoying. After going 25 to 30 feet laterally, the trench turns again to the front, and, after having advanced sufficiently to form a traverse, turns again to the right until it reaches the original line, when it resumes the main direction.

Second Parallel.—The first infantry position established, a second one well advanced is the next objective. It is called the "second parallel" and should be 500 or 600 yards from the enemy's works, or about midway in front of the first parallel. It will develop only the work selected for attack and will thus be shorter than the first. The second parallel, and the approaches to it from the first, may be established in a night, like the first parallel and its approaches, though this will be the exception. With an alert defense the advance from first to second parallel must be by sap. When the heads of the saps are abreast of each other and on the desired line, they may be turned toward each other and run to a connection, forming the second parallel, though, if possible, the work should be expedited by extending parties for simultaneous work.

Third Parallel.—This is about halfway from the second parallel to the enemy's works and is in most cases the position of assault, though sometimes fourth and even fifth parallels have been found necessary. At this close range attention is necessary to guard the sapheads, which can be done by machine guns and rifle fire from the second parallel. As the saps advance the returns may be lengthened and turned so as to form demi-parallels. This enables a stronger guarding force to be kept under shelter and well advanced to repulse sorties or to take the offensive if opportunity offers.

Simultaneous Work.—The preceding shows

the systematic method of procedure with the least losses. However, if the enemy's artillery is fairly well under control and if the terrain is at all suitable, two or more of the parallels or demi-parallels may be constructed at the same time. This result is obtained by sending working parties at night to the position of the advanced parallel or demi-parallel, and these parties hurriedly construct enough of the parallel to obtain shelter against the enemy's fire. During the day and subsequent nights this parallel is completed and the approaches to it are more quickly constructed because working parties are actively engaged at both ends. It is quite often necessary to construct a fourth and fifth parallel in order to maintain troops near the sapheads and protect the sappers at work.

The developments of the late European War and the methods of conflict in trench warfare due to the advances in science, hand grenades, bombs, obstacles, etc., have brought about important changes in the old methods of siege warfare. The essential difference between capture of entrenched places and victory over extended entrenched fronts lies in the fact that the garrison only of the fortress must be subdued while the nation back of an extended front well entrenched must be conquered. While the garrison of a fortress still retains numbers, food, ammunition and morale it may be possible to capture local strong points, but the garrison will not surrender as long as its power of resistance is not broken; other strong points to the rear will be occupied and the resistance continued. It is thus seen that the real objects of trench warfare are to capture local strong points and to break down the resistance of the enemy, making the following general principles self-evident:

(1) Advance in the open is impossible against enemy fire superiority.

(2) Advance by open sap work is difficult against enemy artillery fire and almost impossible if the enemy has artillery fire superiority.

Enclosed Trench.

(3) Advance by mining is effective if the enemy has artillery fire superiority.

(4) An assault against an alert enemy must be preceded by an effective fire of artillery explosive shells to destroy somewhat the enemy trenches and obstacles.

(5) An artillery curtain of fire must be maintained beyond captured enemy trenches in order to assist the successful attackers in

defending the captured trenches against counter attack.

The situation on the west front in Europe illustrated the effect of having masses of trained men facing each other on a relatively short line. From the North Sea to the boundary of Switzerland the battle line extended over a distance of 430 miles. The opposing armies had each constructed triple lines of

Bertin Steps in Face of Trench.

trenches, often supplemented in the rear by a double line of underground shelters where the troops in reserve might rest. Many miles of passageways, saps, galleries and zigzags afforded means of communication between the trenches. At a number of points the hostile lines were less than 100 yards apart and grenades of all types were used in great quantities. There were no flanks to turn, the lines were heavily covered by obstacles, and each side having reserves upon reserves, sapping and mining was freely resorted to in order to gain ground.

The observation of the enemy is of the greatest importance in trench warfare. It should give complete knowledge of all the elements of the hostile line and prompt information of any movement of the enemy. It is effected by observation from the ground and observation by aircraft. Observation from the ground is divided into three echelons: (1) observation in front of the firing line from small posts and listening posts. (2) Observation on the firing line by sentinels and lookouts. (3) Observation in rear of the firing line, by artillery observers, sentinels and lookouts of the shelters.

The location of the lookout posts and observatories are determined in accordance with a complete plan for each supporting point or sector of defense. No part of the hostile front should be free from observation and the parts of the front favorable for the attack of the enemy should be specially watched. An observatory should be located near the command posts of the commanders of strong points, supporting points and sectors. Those of the last two must have extended views over the whole of the terrain.

During a bombardment, the maintenance of lines of information becomes very difficult, but it must be accomplished by all possible methods, such as: (1) Installing telephone under strong shelters. (2) Using lead-covered cable, buried six feet deep, especially for the

lines connecting the regimental, brigade, division and corps headquarters. (3) Placing rockets in all shelters and observatories where officers or non-commissioned officers are posted. (4) Preparing posts for visual signaling, safe from bombardment and defiladed from view of the enemy. These posts are constructed in shelters similar to those for searchlights and are provided with horizontal loopholes with openings to the flank or rear.

Battle-field illumination is a necessity wherever night attacks may be expected. Portable searchlights, both animal and motor drawn, in units up to 36 inches, are now an accepted part of every army. In addition to these powerful lights, trenches are supplied with storage battery or gas reflector lights, star-bombs, rockets and flares, arranged so that they can be put into action instantaneously when an enemy approaches. The entire foreground and obstacles must be illuminated, leaving the defenders in shadow. If a light is used too close to the defenders' parapet, they themselves are illuminated and the light becomes a source of danger.

The use of asphyxiating gases as an auxiliary, both in attack and defense, was frequent in the European War, but was confined to operations where the combatants were facing each other in trenches under conditions similar to a siege. Chlorine or bromine fumes, or a mixture of the two, were the gases most commonly employed. Chlorine and bromine cause death through strangulation by effect on the bronchial tubes and if death is avoided a long, slow, bronchial illness ensues. *Mustard gas* because of its persistency and effectiveness in low concentrations was used ordinarily, in the European War, to gas large areas. For this purpose accuracy in hitting a given point was not necessary and hence the increase in the dispersion of shots at longer ranges was not taken into account as in the case when it was desired to hit a given point. Likewise the number of guns required to cover a given area was small. The high explosive shell, however, changes this method of firing. Since it is deadly both as a high explosive and as a gas, it can and will be used against small targets. In fact, it will be used exactly as high explosive is used, with the single exception that care must be taken to allow sufficient time for the gas to disperse if it is desired to occupy the places bombarded with the gas.

Mounting heavy artillery on railway cars has in no small degree affected siege operations. The idea of so mounting artillery was not born of the war with Germany. The idea was originally American, the first authenticated record of such employment being by the Union forces at the siege of Richmond in 1863, when a 13-inch cast-iron mortar was mounted on a reinforced flat car. In 1913 the commanding officer of the defenses of the Potomac recommended that artillery of various calibre be mounted on railroad platforms, with ammunition, range-finding and repair cars making up complete units, so that this armament could be quickly transported at any time to the place where most needed. It was then apparent that guns in *fixed positions*, of whatever calibres, violated the cardinal military principle of mobility. Of late railway artillery has come to be as varied in its design as field artillery,

each type of railway mount having certain tactical uses, the three types of cannon used being mortars, howitzers and guns. The general types of railway mount adopted are those which give the gun all-around fire (360-degree traverse), provide limited traverse for the gun and allow no lateral movement for the gun on the carriage, but are used on curved track to give the weapons traverse aim. When war was declared against Germany the guns in the United States available for mounting on railway cars are shown in the following table:

NUMBER OF GUNS	Size	Length
	(Inches)	(Calibres)
12.....	7	45
96.....	8	35
129.....	10	34
49.....	12	35
6.....	12	50
150 (Mortars).....	12	10
21.....	14	50

The smaller weapons, such as the 7-inch and the 8-inch guns and the 12-inch mortars, were placed on mounts affording 360-degree traverse. The limited traverse mounts were used for the moderately long-range guns and howitzers. The fixed type of mount was used for long-range guns only, including the sliding railway mounts, such as the American 12-inch and 14-inch sliding mounts and the French Schneider à glissement mounts.

In siege operations, as the result of experience, railway artillery is practically confined to the Barbette, Schneider and Batignolles types of gun mounts. The *Barbette* carriage revolves about a central pintle or axis and turns the gun around with it. In the *Schneider* railway mount the gun and its carriage are fastened rigidly parallel to the long axis of the railway car. Thus the gun itself, independently of any movement of the car, can be pointed only up and down in a vertical plane, having no traverse or swing from left to right, and vice-versa. In order to give the weapon traverse for its aim, special railway curved tracks, called epis, are prepared at the position where it is to be fired. The car is then run along the curve until its traverse aim is correct and the vertical aim is achieved by the movement of the gun itself. In the *Batignolles* type the gun and cradle are mounted on a so-called top carriage that permits of small changes in horizontal pointing right and left. Thus with the railway artillery of the Batignolles type, also, track curves, or epis, are necessary for the accurate aiming. This mount partially cushions the recoil by the movement of the gun itself in the cradle.

While siege operations are largely modified by the advent of military aeronautics, the changes are not great because of the limited weight that the largest airship can carry. The effects of the largest bombs are less terrifying and important than those of the enormous number of gun projectiles, which are thrown with greater accuracy and usually from guns that cannot be seen by those attacked or besieged.

SIEGE ARTILLERY. See **ARTILLERY**.

SIEGE GUN. See **ARTILLERY**; **FORTIFICATIONS**.

SIEGEN, zē'gēn, **Ludwig von**, German-Dutch inventor: b. Utrecht, 1609; d. Wolfenbüttel, 1680. He was a lieutenant in the Hessian army and invented the art of mezzotint engraving which was learned from him by Prince Rupert and so introduced into England. His first work was a portrait of Amelia Elizabeth, mother of the landgrave of Hesse (about 1640).

SIEGEN, Germany, Prussia, a town in the province of Westphalia, on the Sieg River, 47 miles east of Cologne by rail. Two castles, belonging to the period of the Principality, are in this town, several Protestant and Catholic churches, a monument to William I and a bronze bust of Bismarck. It has important mining and manufacturing interests and is the centre of the mining industry of southern Westphalia. It has large tanneries, foundries, factories for cloth, linen, soap, leather and paper, etc. It is on the line of several railways. There is a school of mining and a real gymnasium. Siegen is supposed to be the birthplace of Rubens. Pop. 27,300.

SIEGFRIED, sēg'frēd (Ger. zēg'frēd). See **NIBELUNGENLIED**.

SIEMENS, zē'mēns, **Ernst Werner von**, German engineer and electrician: b. Lenthe, Hanover, 13 Dec. 1816; d. Berlin, 6 Dec. 1892. He entered the Prussian artillery in 1834 and took out his first patent in 1842 for a process of silver and gold electro plating. In 1842 he went to England with his brother, Karl Wilhelm, to establish the business known there by the firm name of Siemens Brothers. In 1844 he took charge of the artillery workshops in Berlin. He aided in developing the telegraphic system in Prussia, and discovered the insulating properties of gutta-percha, which is utilized in underground and submarine cables. He left the army in 1849 and devoted his energies to electrical business, particularly the construction of telegraph apparatus. The first great continental telegraph line, that between Berlin and Frankfurt-on-the-Main, was built by him in 1849, and the firm of Siemens Brothers laid six Atlantic cables. The pneumatic-tube system was invented by him and also various modifications of self-acting dynamos. In 1886 he gave 500,000 marks to found an institute of physics and technology. He published 'Positive Vorschläge zu einem Patentgesetz' (1869); 'Gesammelte Abhandlungen und Vorträge' (1881); 'Wissenschaftliche und technische Arbeiten' (1889-91); 'Lebenserinnerungen' (1892). His collected 'Papers' were translated into English (1892-99), also his 'Recollections' (New York 1893).

SIEMENS, **Sir Karl Wilhelm**, German-English physicist and inventor: b. Lenthe, Hanover, 4 April 1823; d. London, 19 Nov. 1883. He was educated at the gymnasium at Lübeck, the polytechnic school at Magdeburg and the University of Göttingen. At 19 he became a pupil in the engine works of Count Stolberg, and a year later visited England for the purpose of introducing a method of electro-plating, the joint invention of his brother Werner and himself. In the same year the brothers invented

a differential governor for steam-engines, and in 1844 he again went to England to patent this invention. From that time he settled in England, becoming naturalized in 1859. Among the many other inventions with which he, in combination with his brothers, must be credited, are the regenerating gas furnace for metallurgical purposes, the process of making steel and iron direct from ore, which has revolutionized the steel and iron trades, and improvements in the manufacture and laying of telegraph lines. He was elected to the Royal Society in 1862; was one time president of the British Association; and was knighted in 1883. He published 'On the Utilization of Heat and Other Natural Forces' (1878); 'The Dynamo Electric Current and its Steadiness' (1881); 'On the Conservation of Solar Energy' (1883). His 'Scientific Works' were edited by E. F. Bamber (1888). Consult Pole, Dr. 'Life of Sir William Siemens' (London 1888); 'Dictionary of National Biography' (London 1897); *The Times* (London, 20 Nov. 1883).

SIEMERING, zē'mēr-īng, **Rudolph**, German sculptor: b. Königsberg, 10 Aug. 1835; d. 23 Jan. 1905. He attended the local Art Academy in youth and afterward became the pupil of Blaser in Berlin. For the decoration of Königsberg University he furnished medalion portraits of its learned men. In 1860 he produced his 'Penelope' and in 1860 a sitting figure in marble of King Wilhelm for the Exchange in Berlin; and a terra-cotta statue of Leibnitz for the Academy of Science at Perth, productions remarkable for realistic modeling and imposing expression. In 1871 he executed the masterly relief 'Uprising of the People at the Summons of their King'; and the following year a design for the Goethe monument. His next work was the statue of Frederick the Great for Marienburg. The greatest of his works, however, was the war monument in the market place at Leipzig, 'Germany,' as an armed heroine. Worthy also of special notice was the sitting statue of Emperor William I with the four colossal equestrian figures—King Albert of Saxony, Emperor Frederick, Bismarck, Moltke and eight figures of soldiers. He was the author of the colossal equestrian statue of Washington whose pedestal is enriched with reliefs and accessory sculptures. This impressive monument was unveiled in Fairmount Park, Philadelphia, May 1897. Siemering's group, 'Saint Gertrude Hospitably receiving a Traveling Scholar,' was finished and set upon the Bridge of Saint Gertrude at Berlin in 1896. He was also the author of numerous portrait busts.

SIEMIRADZKI, syēm-ī-rāz'kī, **Henryk**, Polish painter: b. near Kharkov, Grodno government, 15 Nov. 1843; d. 1902. He studied art in the Academy of Saint Petersburg and after a sojourn in Munich, fixed his studio in Rome. Among his best canvases are 'Nero's Torches' (1876) now in the National Museum, Cracow; 'The Vase or the Slave' (1879); 'The Amulet-Seller' (1888); 'Christ Stilling the Waves'; 'The Sword Dance' (1880); 'Phryne at Eleusis' (1889), in the Alexander Museum, Petrograd; 'Christ with Martha and Mary' (1886). He also decorated with much skill two ceilings in the Netchaïev Palace of Petrograd and several churches of Cracow and Moscow.

SIENA, sē-ā'nā, or **SIENNA**, sē-ēn'nā, Italy, (1) Capital of a province of the same name and an archiepiscopal see, 61 miles south of Florence, occupies a lofty site 1,100 feet above sea-level on the southern frontiers of Tuscany. It is enclosed by an Etruscan wall with nine gates, has a strong citadel and is in all respects a typical Italian town; the Piazza di Vittorio Emanuele is historical. Siena outranks all the other cities in its art history from the 13th to the 16th centuries (excepting Rome and Florence). This art is largely represented in its public buildings; the fine Gothic cathedral (13th century) has a remarkable façade inlaid with marbles of various colors and with profuse decorations, after a design by Pisano. The interior contains a famous pulpit by the same sculptor (1274); a mosaic pavement inlaid with biblical scenes and magnificent choir stalls of fine renaissance; 6 paintings by Michelangelo; bronze statue of John the Baptist, by Donatello; a high-altar by Peruzzi, etc. In the library are the celebrated frescoes by Pinturicchio and the finely illuminated choir-books, resting on elaborately carved desks. On the south side of the cathedral is the antique marble group of the three graces, found (1460) in the Palazzo Colonna at Rome. Beneath the cathedral the Church of San Giovanni is enclosed as a crypt. It was formerly a baptistery and contains some fine baptismal fonts and bronze bas-reliefs. The other most interesting churches are San Domenico, Fontegiusta, Santo Bernardino, Fonte Gaja, San Agostino, the Collegiata di Provenzano, etc., all rich in *chef d'œuvres* of painting and sculpture by Sienese and other Italian artists. The city contains numerous and splendid palaces, municipal offices and public institutions, including the Palazzi Tolomei (1205) and Buonsignori; Palazzo del Governo, containing valuable archives (52,000 manuscripts); Palazzo Spanocchi (now post office and telegraph bureau); the Loggia dei Nobili (in imitation of the Loggia dei Lanzi at Florence), and the Palazzo Pubblico. The Istituto dei Belli Arti contains a fine collection of paintings of the early Sienese school, from the dismantled monasteries and modern works; the Public Library contains 84,000 volumes and 5,000 manuscripts; the Accademia dei Fisiocritici contains a museum of natural history; the University (1321) has limited facilities and but two faculties; there are a lyceum, a technical school, a theatre and many prosperous charitable institutions and hospitals. Fonte Gaia, Fontebranda — immortalized by Dante — and Fonte Nuova are among the beautiful fountains and at the southeast stands the Benedictine convent "Monte-Oliveto Maggiore" on the summit of Mount Acorur, with fine frescoes. The Lizza promenade is much frequented. The manufactures are unimportant, weaving being the most essential; trade consists chiefly in common and fine marble, cloth, furniture, silk and velvet.

Its history is somewhat mythical as to origin and of ancient date. From the Etruscans — its founders — it passed into the hands of the Romans and then to the Lombards. The people rebelled against the rule of the nobles in the 12th century and warred with Florence in that and the succeeding century and in the 14th century they resigned their

liberties to the Duke of Milan, after many years of internal strife; especially memorable is the strife of 1480, when Pandolfo Petrucci acquired practical control of the state. Later, the city placed itself under the protection of Charles V of Spain, thus acquiring a burden of tyranny, while hoping to be freed from a petty despotism, and became the scene of frequent riot and bloodshed. The Sienese then entered into treaty with France. Finally, after renewed hostilities by Spain and Cosimo I de' Medici, Siena was reduced and annexed to Tuscany. In 1859, the city was the first to vote for the monarchy of Victor Emmanuel II, which led to the union of the Italian states. Pop. 41,673. Consult Douglas, L., 'History of Siena' (New York 1903); Gardner, E. G., 'Story of Siena' (London 1913); Hutton, Edward, 'Siena and Southern Tuscany' (New York 1912); Schevill, Ferdinand, 'Siena: Story of a Mediæval Commune' (ib. 1909). The Province of Siena, in the grand duchy of Tuscany, covers an area of 1,471 square miles and is divided into two districts, Montepulciano and Siena. There is an important agricultural industry; also an extensive silk industry. The chief products are wheat, wine and olives. The province is traversed by the Florence-Rome Railway which branches off at Asciano toward Siena. Pop. 244,850.

SIENKIEWICZ, syën-kye'vich, Henryk, Polish novelist: b. Vola Okrzeyska, Siedlce, 4 May 1846. He was educated at the University of Warsaw, published some critical articles in 1869, was for a time editor of *Słowo*, a journal of Warsaw, and in 1870 sent to press his first work of fiction, 'Na Marne,' rendered into English by the official translator, Jeremiah Curtin (q.v.), as 'In Vain' (1899). In 1876 he came to the United States, where for a time he remained in California. He traveled also in central Africa in 1891. Among his chief works accessible in English are the following, all by Curtin except where otherwise specified: 'The Deluge' (1891); 'With Fire and Sword' (1893); 'Without Dogma' (Young) (1893); 'Pan Michael' (1894); 'Quo Vadis?' (1897), with scene in the Rome of Nero, his best-known book; 'Let Us Follow Him' (1897); 'So Runs the World' (the Soissons) (1898); 'On the Bright Shore' (1898); 'Sielanka and Other Stories' (1898); and 'Knights of the Cross' (1899). Perhaps his best work is to be found in 'With Fire and Sword,' 'The Deluge,' and 'Pan Michael.' Quo Vadis has been translated into nearly every modern language and has been dramatized frequently with great success. In 1905 he received the Nobel prize in literature. Consult Phelps, W. L., 'Essays on Modern Novelists' (New York 1910).

SIENNA. A brownish-orange-yellow pigment consisting of clay colored by iron and manganese oxide.

SIERRA, Justo, Mexican educator and statesman: b. Campeche, 26 Jan. 1848. At the age of 23 he became a lawyer and advocate. After the downfall of President Lerdo, Sierra retired from politics, but soon re-entered public service as a member of the lower branch of the federal congress. In this position his education, oratorical abilities and intense loyalty soon won for him great influence and

prominence. He was called from Europe, where he was serving on an important mission, to become secretary of public instruction. A number of his historical and educational works are used as textbooks in the National Preparatory School and in other institutions of learning.

SIERRA LEONE, sē-ēr'rá lē-ō'ně or lē-ōn' (Sp. lā-ō'nā), West Africa, a British colonial territory, consisting of a colony proper and a more extensive protectorate. The colony consists of the peninsula of Sierra Leone, about 25 miles long and 12 miles broad, of Sherbro Island and a few islets and of all the coast strip between French Guinea and Liberia; total area, about 4,000 square miles. The capital, Freetown, is at the northwest extremity of the peninsula. The protectorate extends inland so as to have French Guinea on the north, Liberia on the east and southeast; area, about 30,000 square miles. The surface near the shore, though sometimes rocky, is generally flat, but in the interior are many hills and mountains, varying in height from 500 to 3,000 feet. Some parts are low and swampy; most parts are well watered. The soil, of which only a comparatively small portion is under regular cultivation, is fertile, growing excellent crops of rice, Indian-corn, yams, plantains, pumpkins and cassava. Sugar, coffee, indigo, ginger and cotton also thrive well. The fruits include the boabab, cocoanut, banana, pineapple, orange, lime, guava, papaw, pomegranate, etc. The forests are extensive and the trees in them are often so magnificent as to be converted into canoes capable of containing 100 men. The principal livestock are pigs and goats. Poultry also, particularly guinea-fowls, are very abundant. The fisheries both on the coast and in the rivers are productive. The chief industrial establishments are those in which the palm-oil is extracted and prepared. Boat-building is also carried on to some extent, native cloth is woven, and leather is dressed on a small scale. Trade is carried on chiefly with Great Britain. The total value of imports for the year 1915 was \$6,278,775; of exports, \$6,273,105. The total tonnage of vessels entered and cleared for the same year was 1,635,119 tons, of which 1,520,998 were British. The principal articles of import are cottons, wines and spirits, tobacco, apparel, haberdashery, flour, salt, etc.; of exports, palm-kernels, kola-nuts, gum copal, ginger, benniseed, etc. The total revenue in 1915 was \$2,522,120, and the expenditure amounted to about \$2,733,855. The strongest religious bodies are the Church of England and the Wesleyan Methodists. The number of white inhabitants is only about 700. Education is denominational, but is assisted by state aid. There are some 112 elementary schools, the number of pupils on the rolls being over 7,000. There is a college at Furih Bay for the education of native ministry, supported by the Church Missionary Society and affiliated to Durham University; secondary schools for boys and for girls at Freetown, a technical school, etc. Sierra Leone was discovered by the Portuguese in 1463 and first became a British colony in 1787. Soon after, a company was formed with the humane intention of making it a home for free negroes, and proving by their means that colonial prod-

ucts could be raised without slave-labor. In 1800 a grant of the peninsula was made to the company, but in 1807 the company ceded all their rights to the Crown. Since then the position of Sierra Leone has varied at different times. Its affairs are now administered by a governor and an executive council of several official members, with a legislative council. One great obstacle to its prosperity is the deadly nature of its climate, particularly to Europeans; but its progress, though slow, has been steady. The natives can live in comfort with little exertion. Freetown (q.v.) is now a fortified coaling station and centre of trade. A railway runs from Freetown to Pendembu, near the Liberian frontier, a length of 227½ miles. From Boia Junction, 64 miles from Freetown, a branch line runs to Kamabai, a distance of 104 miles, and a further extension to Baga is contemplated. Pop. 75,572; with protectorate, about 1,400,000.

Protectorate, The.—By an order in council of 7 March 1913 all the territories, not being portions of the colony of Sierra Leone, to be between the sixth and tenth degrees of north latitude and the tenth and fourteenth degrees of west longitude and beginning at the extreme southerly point of the colony on the Anglo-Liberian boundary were included in the Protectorate of Sierra Leone. The governor and commander-in-chief for the time being of the colony of Sierra Leone is also the governor of the Protectorate. Authority is given to the legislative council of Sierra Leone by ordinance, to exercise and provide for giving effect to the powers and jurisdiction acquired by the Crown. The area of the protectorate is 27,000 square miles and the population numbers 1,327,560. The territory is divided into five districts each of which is under a European commission. There are circuit courts in all chief centres of population, also district commissioners' courts, chiefs' courts for native cases and combined courts for small debts and certain misdemeanors between natives and non-natives. Imports comprise, cotton goods, spirits, hardware and tobacco; exports, palm kernels, kola nuts and palm oil. There are Mohammedan and mission schools. There is a government school at Bo, for the sons and nominees of native chiefs. It now has 113 pupils.

SIERRA MADRE, mā'drā (Sp. mā'thrā), (1) A range of mountains in southern California, in Los Angeles and adjoining counties on the northeast. (2) A range in the southern part of Wyoming in Carbon County. (3) The range in Mexico which borders the plateau on the west. It is a continuation of the range on

the western border of the Great Salt Lake Basin in the United States. In Mexico, the range is much broken; the peaks, except a few, do not exceed 10,000 feet in height. This range is sometimes called Sierra Madre del Pacifico. In southern Mexico is a range called Sierra Madre del Sur. (See MEXICO). (4) One of the three principal mountain ranges of the island of Luzon, Philippines. It begins at Caraballo de Baler, in the southeastern part of the province of Nueva Ecija and extends northeast to Cape Engaño, the northeast point of the island. A branch of this range called Mamparán starting at Caraballo Sur, in the northern part of Nueva Ecija, extends to the north. The highest peak is Mount Moises.

SIERRA MADRE DEL PACIFICO. See SIERRA MADRE.

SIERRA MADRE DEL SUR. See SIERRA MADRE.

SIERRA MORENA, mō-rē'nā, Spain, an irregular mountain chain, about 380 miles in extent, which forms the watershed between the Guadiana and Guadalquivir rivers, and extends between the south and the northern boundaries of Andalusia, for which reason it is sometimes known as the Andalusian System. This system consists of three distinct parts. The eastern division through which the railroad and highway pass on the way to Madrid presents a magnificent landscape. Here is the celebrated pass, Puerto de Despeñaperros. The highest summits are Cerro Estrella (5,500 feet), in the west, and in Estremadura, the Tudia. On the watershed, between the Murtiga and the Huelva near the source of the Adiel, the water fall is great; many chestnut trees and cork oaks are found; also extensive marble quarries. The range abounds in copper, zinc, quicksilver, iron, etc.

SIERRA NEVADA, a range of mountains in eastern California, separating the interior basin of Nevada from the valley of California. It is in the form of a tilted plateau from 50 to 100 miles wide and extending from northwest to southeast for about 450 miles. In the south it runs westward and is united by Mount San Bernardino with the Coast Range, which runs parallel with the Pacific. It is the source of a multitude of rivers which swell the Sacramento and San Joaquin. Its northern continuation into Oregon is known as the Cascade Range. The crest has an average elevation of over 11,000 feet. The range falls very abruptly on the east along a great fault line and slopes gradually on the western side. Its rocks consist of schists, slates, granite and diabase covered with volcanic rocks of the Tertiary period. The range was first folded at the close of the Jurassic. The highest peaks are on the eastern margin near the southern end. Mount Whitney, the highest point in the United States proper, reaches an altitude of 14,502 feet. Other peaks with their altitudes are Fisherman Peak, 14,448 feet; Mount Corcoran, 14,093 feet; Mount Brewer, 13,886 feet; Mount Kaweah, 13,752 feet; Mount Lyell, 13,090 feet. There is perpetual snow on the higher points and there are a number of small glaciers. Coniferous forests cover the range to about 8,000 feet and on the west slope are deciduous trees and at a certain elevation above these are found the famous big

trees (*Sequoia gigantea*). The chief passes are the Truckee, 7,200 feet, and crossed by the Central Pacific; the Beckworth, 5,190 feet; the Walker, 5,320 feet; Tehachapi, 3,830 feet, and crossed by the Southern Pacific. Consult Muir, John, 'Mountains of California' (New York 1911); id., 'My First Summer in the Sierra' (Boston 1911).

SIERRA NEVADA, nā-vā'thā (Spanish, "snowy range"), (1) The loftiest mountain range in Spain. It extends east and west through Andalusia and Granada, terminating on the Mediterranean shore, where it forms several promontories. To the east it passes gradually into the lower plateau regions. It has numerous spurs enclosing deep valleys. Mica slate is its chief constituent, and vegetation is scanty except in the lower valleys. Snow remains on the peaks the greater part of the year, and there are several permanent glaciers, those on the Veleta being the southernmost in Europe. Its highest peak, Mulahacen (11,678 feet), is covered by perpetual snow; Veleta, next in height, has an elevation of 11,378 feet. These high peaks are penetrated by deep valleys or gorges, with here and there small, icy lakes, of which the Corral de Veleta extends into an immense glacier 8,580 feet high. The loftiest pass is the Collado de Veleta (9,900 feet), where the snow line is from 8,970 to 9,300 feet high.

SIEYÈS, sê-ā-yās, Emmanuel Joseph (the Abbé Sieyès), French statesman: b. Fréjus, 3 May 1748; d. Paris, 20 June 1836. He began his studies at the University of Paris, and when the Revolution broke out he took an active part in furthering its progress, and wrote three pamphlets on the mode in which the three estates were to vote, whereby he was brought into very general and favorable notice. With him originated the idea of a new geographical division of France into departments, arrondissements and communes. He also took an active part in the formation of the new constitution, and was in 1791 member for the department of the Seine. In 1792 he was deputy for the department of the Sarthe; but generally contented himself with merely recording his vote. During the Reign of Terror he withdrew into the country, but on the downfall of Robespierre he returned to the convention and took an active part in public measures, more especially foreign affairs, conducting several important negotiations with other states. In 1798 he went on a mission to Berlin, and succeeded in securing the neutrality of Prussia. On his return in 1799 he succeeded Rewbell as a member of the Directory, and shortly after succeeded in displacing three of his colleagues, so as to obtain a majority favorable to his views. He afterward, with the assistance of Fouché, closed the Jacobin Club. This measure made him very obnoxious to the extreme Republican party, and under the conviction that faction was now to be kept down only by force he began to look out for a military leader. He thought of several, but fixed at last on Bonaparte. The revolution of the 18th Brumaire was the result; but Sieyès, who hoped he had only obtained a coadjutor, soon learned that he had subjected himself to a master. He did not, however, retire unrewarded, but proved that the simplicity and disinterestedness of which he had boasted were more nominal than real, by

obtaining, of lands at least \$250,000 exposition (Paris 1789) institutionell verger, E. 'Tableau politique' 1873); VIII, Ne 1746-1836 (Paris 1836) mémoires

obtaining, along with the title of count, grants of lands and other property to the value of at least \$250,000. He wrote 'Reconnaissance et exposition des droits de l'homme et du citoyen' (Paris 1789). Consult Boulay, 'Théorie constitutionnelle de Sieyès' (Paris 1836); Beauverger, Edmond de, 'Etude sur Sieyès' (in 'Tableau historique du progrès de la philosophie politique' (ib. 1858); Bignon, 'Sieyès' (ib. 1873); 'Cambridge Modern History' (Vol. VIII, New York 1904); Neton, A., 'Sieyès, 1746-1836, d'après des documents inédits' (Paris 1900); Mignet, F. A. L., 'Notices et mémoires historiques' (Vol. I, Paris 1843).

SIFBLEUR, an American ground squirrel, nearly equalling a rabbit in size, common in the Rocky Mountain region. It is so called from the loud eerie whistle with which it wakes the echoes of the crags about the lone pastures above timber line, where it makes its home; it was of great service to the mountain Indians. See **MARMOT**.

SIFFU, sēf-foo', or **SIBBU**, sēb-boo', a river of the island of Luzon, Philippines. It rises in the eastern part of the province of Bontoc and flows south and east through the province of Isabela to the Rio Grande de Cagayan; it is one of the most important tributaries of the Cagayan in Isabela.

SIFTON, Arthur Lewis, Canadian jurist and statesman, brother of Sir C. Sifton (q.v.): b. Saint John's, Ontario, 26 Oct. 1858. He was educated at Wesley College, Winnipeg, and at Victoria University, Cobourg. He settled in the Northwest Territory in 1875 and in 1883 was called to the bar. He served in the legislature of the Northwest Territory in 1899-1903; was treasurer and commissioner of public works in the ministry of F. W. G. Haultain (q.v.); and in 1903-05 he was chief justice of the Supreme Court of the Northwest Territory. Upon the establishment in 1905 of the province of Alberta he became chief justice of its Supreme Court, and in 1910-17 he was premier of that province.

SIFTON, Sir Clifford, Canadian lawyer and statesman: b. Middlesex County, Ontario, 10 March 1861. He was graduated at Victoria University, Cobourg, in 1880, settled in Manitoba and in 1882 was called to the bar. He sat in the Manitoba legislature in 1888-96, was attorney-general in the Greenway ministry in 1891-96 and in 1896-1911 he was Minister of the Interior in the Laurier administration of Ottawa. His most notable work was in the promotion of immigration to Canada. He was an opponent of separate schools in Manitoba; and in 1911 left the Laurier Cabinet because of his opposition to the reciprocity treaty then under discussion between the United States and Canada.

SIGEBERT OF GEMBLoux, sezh'bért' ov zhān'bloo', Belgian mediæval chronicler: b. Brabant, c. 1030; d. Gembloux, 5 Oct. 1112. He early became a monk in the Benedictine abbey of Gembloux, where, with the exception of a period as a teacher at Metz, he passed all his life in teaching, and writing the works that have perpetuated his name. Chief of these is 'Chronographia,' covering history from 381 to 1111 A.D. It appears in 'Monumenta Germaniae historica Scriptores' (Vol. VI, ed. with in-

trod. by L. C. Bethmann). Other works are 'Vita Sigeberti III regis Austrasiæ,' a life of the Frankish King Sigebert III; 'Gesta abbatum Gemblacensium,' a history of the early abbots of Gembloux to 1048; and the hagiographical biographies, 'Vita Deoderici, Mettersis episcopi,' a life of Bishop Dietrich of Metz, d. 984, who founded Saint Vincent's Abbey in that city; and 'Vita Wicberti,' a life of Wicbert or Guibert, d. 962, who founded the abbey of Gembloux. Consult Hirsch, S., 'De vita et scriptis Sigeberti Gemblacensis' (Berlin 1841); Molinier, A., 'Les Sources de l'histoire de France' (Vols. II and V, Paris 1902-04); Wattenbach, W., 'Deutschlands Geschichtsquellen' (Vol. II, Berlin 1894).

SIGEL, sē'gēl, Franz, American military officer: b. Sinsheim, Baden, 18 Nov. 1824; d. New York, 21 Aug. 1902. He was graduated from the military school at Karlsruhe in 1843 and was commissioned lieutenant in the army, but resigned in 1847. In 1848 he raised a corps of volunteers to serve in the Baden insurrection and became commander-in-chief of the revolutionists. Arrested by the Swiss authorities in 1851 he escaped and in 1852 came to the United States. He settled in New York and conducted there a military magazine *Die Revue*, removing in 1857 to Saint Louis where he established a similar paper and also engaged in teaching. At the outbreak of the Civil War he organized a regiment for the Federal army and went to the front; participated in the battles of Carthage, Dug Springs and Pea Ridge; and in May 1861 was commissioned brigadier-general of volunteers. He was promoted major-general in 1862 and assigned to a corps in the Army of Virginia, which he commanded in the series of operations from Cedar Creek to the second battle of Bull Run. He was appointed to command the Western Pennsylvania Reserves in 1863 and in 1864 was transferred to the command of the Department of Western Virginia, successfully defending Maryland Heights against General Early's raid in July 1864, though his force was but 4,000 men against 15,000. He resigned his commission after the war, was editor of the *Baltimore Wrecker* in 1865-67 and later removed to New York. He was appointed collector of internal revenue in 1871 and elected registrar of New York in the same year. In 1868 he was appointed pension-agent, and later edited the *New York Monthly*, a German-American publication, and was the author of various essays on military subjects.

SIGERSON, George (pseud. ERIONNACH), Irish poet, physician, botanist and educator: b. Holy Hill, County Tyrone, about 1839. He was educated at Queen's College, Cork, and later studied in Dublin and Paris. He was professor of botany at the Catholic University, Dublin, and was afterward professor of zoology at University College, Dublin. He exercised a profound influence over the Celtic revival, is an authority on Irish literature and history and has written ably on Irish land tenure, political prisoners and kindred subjects for the *Irishman*, the *Nation* (Dublin) and the *Harp*. He performed a notable service to Irish letters in his translation of Celtic poetry, 'The Poets and Poetry of Munster' (1860) and 'Bards of Gael and Gall' (1897; 2d ed., 1907). His own

verse is well known and is included in the modern Irish anthologies.

SIGHING, an act of respiration beginning in an involuntary, often sudden, sometimes prolonged inspiration, in which the diaphragm descends; the expiratory act which follows, and which constitutes the "sigh," being caused by the recoil of the chest-walls and lungs and by the action of the abdominal muscles. Sighing usually illustrates simple respiration as modified by mental or emotional conditions or by some factor of sensation. During strained attention, as when listening to a thrilling speaker, or witnessing an exciting scene, the respirations become very short and quickly recurring, with an occasional long sighing inspiration at intervals.

SIGHT. See **EYE**; **SENSES**; **VISION**.

SIGHT, Defects of. See **VISION, DEFECTS OF**.

SIGILLARIA, sĭj-ĭ-lā'ri-ā, a genus of fossil plants found in great abundance in the coal measures. The plant occurs in the form of compressed stems attaining a height of 40 to 50 feet, and a breadth of five feet. The stem is seldom found preserved so as to show any structure or even its cylindrical form; it generally occurs as a double layer of coal, showing on the outer surfaces longitudinal furrows due to the arrangement of the leaves on the stem, and at regular intervals the scars produced by the bases of the leaf-stalks. The roots are found preserved in the shale which forms the floor of all coal seams; they were originally supposed to be distinct plants, and have received the generic name of *Stigmara*. No foliage of any kind has been found connected with the trunk. Some suppose *Sigillaria*s to be allied to tree-ferns, others to *Conifera*. King says that if in imagination we delineate a channeled stem of any height between 12 and 100 feet, crowned with a pendant fern-like foliage, furnished with wide-spreading fibrilled roots, and growing in some densely-wooded swamp of an ancient Mississippi, we will then have formed a tolerably close restoration of a *sigillaria* growing in its true habitat.

SIGISMUND, ʃĭj'is-münd (Ger. zē'gĭs-moont), emperor of Germany, son of Charles IV: b. 14 Feb. 1368; d. Znaim, Moravia, 9 Dec. 1437. He succeeded to the margraviate of Brandenburg on the death of his father, Emperor Charles IV, in 1378, while his brother Wenceslaus, king of Bohemia, succeeded to the throne. By his marriage to Mary, heir of Louis the Great, king of Poland and Hungary, he became heir-apparent to the throne of these two countries, but on the death of Louis in 1383 the Poles chose Hedwig, Louis' younger daughter, for their queen, and the regency of the Hungarian throne was seized by Charles Durazzo, while Mary was kept in captivity. Sigismund rescued her and on the murder of Durazzo was crowned king of Hungary in 1387. His war against the Turks, though supported by the French and German chivalry, resulted in a disastrous defeat at Nicopolis in 1396, and Sigismund was compelled to escape into Greece. On his return to Hungary in 1401 he found his queen dead, his throne occupied by Ladislaus of Naples and his brother Wenceslaus maintaining with difficulty his throne in Bohemia, having been deposed in Germany. He

was imprisoned by Ladislaus, but escaped, raised a large force and in 1403 succeeded in expelling Ladislaus and subduing the kingdom. In 1411 he was elected emperor of Germany and was crowned Holy Roman emperor at Aix-la-Chapelle in 1414. During the Council of Constance in 1414 he allowed John Huss to be put to death for heresy, an act which resulted in the Hussite War. Wenceslaus died in 1419, but it was not until 1431, when Sigismund signed the compact with the Council of Basel, that the Hussites would permit the acknowledgment of his succession to the Bohemian throne. He was crowned emperor in Milan in 1431, and his coronation was repeated in Rome in 1433. The Luxemburg dynasty became extinct at his death, as he was succeeded by his son-in-law, Albert II of Saxony. Consult Aschbach, J. G., 'Geschichte Kaiser Siegmunds' (4 vols. Hamburg 1845); Main, A., 'The Emperor Sigismund' (London 1903); Schiff, Otto, 'Kaiser Siegmunds italienische Politik' (Frankfort 1910); Windecke, E., 'Denkwürdigkeiten zur Geschichte des zeitalten Kaiser Sigmund's' (Berlin 1893).

SIGISMUND I, surnamed **THE GREAT**, king of Poland: b. 1 Jan. 1467; d. Cracow, 1 April 1538. He was the youngest son of King Casimir IV, and in 1506 succeeded his brother Alexander on the throne of Poland. The war with the Russians, which was urged forward by the Lithuanian prince Michael Glinski, gave him employment throughout his whole reign. The peace of Poland was also disturbed by inroads of the Tartars and of the Wallachians. On the other hand Poland was increased by the addition of Masovia. By his toleration the Reformation spread in Poland, and Protestantism became the prevailing religion both in Grand Poland and Polish Prussia. Sigismund, after the death of his wife, Barbara Zapolika, married a daughter of the waywode of Transylvania and Bona Sforza of Milan. This marriage was the cause of many misfortunes to the country. The Italian soon secured for herself an influence in the government, sold the public offices and at last placed Piotr Kmita at the head of the administration, which acts contributed to destroy the popularity of the king. Under Sigismund the golden age of ancient Polish literature began.

SIGISMUND II, **Augustus**, king of Poland: b. 1 Aug. 1520; d. Knyszyn, 14 July 1572. He was son of Sigismund I, and was appointed king in 1529, in the lifetime of his father, and in 1544 obtained the government of Lithuania. His mother, Bona Sforza, allowed him to grow up in luxury and effeminacy that she might be able to continue her influence during the government of her son; but upon his accession he disappointed her expectations. When by the revival of ancient laws he proceeded firmly in curtailing the powers of the nobility they endeavored unsuccessfully to depose him. Bona, universally hated, finally quitted Poland with immense treasures for Italy, where she was poisoned by her paramour in 1557. Under Sigismund the Reformation made great progress in Poland, and many senators, landed proprietors, bishops and clergy exchanged the Roman Catholic faith for Protestantism. In 1563 Sigismund gave toleration to the different

religious parties, and in 1572, at the Diet of Warsaw, proclaimed universal religious freedom. With his death the Jagellon race became extinct. See **POLAND**.

SIGISMUND III, or **SIGISMUND VASA**, king of Poland and Sweden: b. 1566; d. Warsaw, 1632. He was the only son of John III, king of Sweden, and of the Polish princess Catharina, a sister of Augustus Sigismund II. After the death of Stephen Bathori he was invited, in 1587, to become king of Poland, and having sworn the *Pacta Conventa* was crowned at Cracow. He was a very zealous Catholic, and his principal aim was the extension of the Roman Catholic faith in Poland. On the death of his father, John III, in 1592, he set out for Sweden to take possession of the throne to which he had succeeded, and was crowned in 1594. On his return to Poland he was obliged to leave Sweden under the regency of his uncle who ultimately reigned over it as Charles IX. Sigismund's refusal to give up the Swedish crown, of which he became deprived, involved Poland in a disastrous war with Sweden, which lasted for 60 years. Consult Niemcewicz, S., 'Mémoires' (Lemberg 1899); Niemcewicz, J. U., 'History of the Reign of Sigismund III' (Breslau 1836); 'Sveriges Historia' (Vol. III, Stockholm 1881); Rembowski, A., 'The Insurrection of Zebrzydowski' (Cracow 1893).

SIGL, zé'gl, **Georg**, mechanical inventor: b. Breitenfúrh, Lower Austria, 1811; d. Vienna, 9 May 1887. He was in youth apprenticed to a locksmith and practised his trade in Bavaria, Württemberg and Switzerland. In 1832 he took employment in the rapid printing press factory of Helwig and Müller, and in 1837 introduced the manufacture of rapid printing presses into the hand press factory of Dingler in Zweibrück, and opened a branch factory of the same sort in Vienna, where he constructed the first rapid lithographic press (1851). Later he manufactured rotary presses, and applied himself to improving the locomotive and other machinery.

SIGMA XI (Σπουδών Συνωτες, 'companions in zealous research'), a college honorary society for scientific students, founded at Cornell University in 1886 and now possessing chapters in 30 colleges and schools. It provides for scientific students a society similar to that of Phi Beta Kappa in literature. Its object is to provide meetings for the discussion of the work of its members, promotion of a fraternal feeling among them, the encouragement of original research in pure and applied science and to aid scientific progress by the publication of material dealing with its development and achievements. The membership includes resident professors and instructors, graduates and, in limited numbers, undergraduates who evidence unusual promise. Honorary membership is accorded scientists who have achieved important work in either pure or applied science. The badge or insignia is a gold watch pendant in the form of a monogram of the two letters of the Society. Annual conventions are held, each chapter sending three delegates who meet with the council of the Society. The Society was at first averse to extending its organization, but there are now 30 chapters, of which that at Yale University was established

in 1895 and that at Columbia in 1915. The combined membership of the Society is about 10,000, of whom about 2,300 are active members. Since March 1913 the Society has published the *Sigma Xi Quarterly*. Consult Ward, H. B., 'Sigma Xi Quarter Century Record and History, 1886-1911' (1911).

SIGN LANGUAGES are vehicles of communication by gestures, principally employed by primitive peoples, such as the American Indians. They are of two kinds, the descriptive and the characteristic or indicative signs. Descriptive signs involve an account, more or less complete, of the appearance, qualities and uses of an object, or the circumstances of an event, for the purpose of description or explanation; and must, from their nature, be varied, like a painting, only by the point of view from which the objects are described, or the capacity and accuracy of the person that describes. The indicative signs, on the contrary, which are employed in common conversation, are usually mere abbreviations of these, involving a single striking feature of the person, or object, or event; as an elephant is indicated by its trunk, a flower by its fragrance or a town by a collection of roofs. The signs of persons are usually conventional, and derived from some feature, or mark, or habit but often from an accidental circumstance in dress, etc., which struck the deaf-mute on first seeing the person and is still referred to when it no longer exists. This form of expression, as developed in certain institutions for deaf-mutes, is of a character which those who value it least admit to surpass speech in the force with which it communicates the feelings and states of mind. Like painting (as Condillac observes) it has the immense advantage of presenting a group of ideas at once, which lose much of their force and beauty by being detailed in the successive words and artificial arrangements of written language. The eye, the hand, the whole body, speak simultaneously on one subject; the representation changes every moment, and these peculiarities, with the elliptical form of expression which is adopted in conversation, give a rapidity to communication by the sign language which, on common subjects among those familiar with it, surpasses that of speech. If we remark the new shades of meaning given to the same words by the varying attitude and general expression of the speaker, and the accuracy with which a nice observer will discover, in these signs, the thoughts, and feelings, and intentions, even of one who wishes to conceal them, we shall find reason to believe that they are capable of conveying the most delicate shades of thought. Generic and abstract terms, as their objects do not exist in nature, have no corresponding terms of equal clearness in the sign language; and the abbreviated manner in which we express relations by conjunctions, prepositions, relatives and inflections, can only be imitated by adopting similar conventional signs, which do not easily fall in with the idiom of the language. In these respects, therefore, the sign language lacks the algebraic brevity and accuracy which are found in artificial languages, and which render these so invaluable as mediums of thought and instruments of philosophical investigation; at

the same time it is capable of describing what is conveyed by these forms, with an accuracy at least as great as that of words by circumlocution and example. It is worthy of remark that the order of expression in the sign language is that which we term inverted—the subject before the quality, the object before the action and, generally, the thing modified before the modifier. This language, in its elements, is to be found among all nations and has ever been the medium of communication between voyagers and the natives of newly-discovered countries. It is employed by many savage tribes to supply the paucity of expression in their language, or to communicate with other tribes, as has been observed among the Indians of North America. Among the Indians of the western regions of the United States, Major Long found it an organized language employed between tribes who spoke different articulate languages. His account, as well as others given by subsequent inquirers, shows that it corresponds very closely with that adopted in the school of Paris; and a Hawaiian, who visited an American asylum for deaf-mutes, gave a narrative of his life in the sign language, which was perfectly understood by the pupils. As a proof that the sign language does possess a universal character in its cultivated form, a trustworthy authority, who himself acquired it in this form, has asserted that he employed it, or had seen it employed, with success, in communicating with an American Indian, a Hawaiian, a Chinese and the deaf and dumb in various parts of the United States, in England, Scotland, France, Germany, Switzerland and Italy. Consult Clark, W. P., 'The Indian Sign Language' (Washington 1885); Mallery, G., 'Introduction to the Study of Sign Language among the North American Indians' (Washington 1880); id., 'A Collection of Gesture Signs,' etc. (ib.); id., 'Sign Language among North American Indians' (1881); Roth, W. E., 'Ethnological Studies . . . Queensland Aborigines' (London 1897).

SIGNAL SERVICE. The. See METEOROLOGY.

SIGNALS, Naval, the means of transmitting intelligence at sea by the agency of sight or hearing. These means are divided into three classes: day signals, night signals and day and night signals. The first consist of flags or shapes, moving arms or shapes or the waving of them. The day and night signals used in the United States navy are found in the 'General Signal Book' and the 'Fleet Drill Book.' The first comprises about 7,000 words and sentences arranged alphabetically and regularly numbered. Resort is had also to a vocabulary of about 10,000 conversational terms, to which is added an alphabet and a geographical list of about 11,000 places, each letter and word having its appropriate number. The 'Fleet Drill Book' relates to the tactical formations of a fleet or squadron. Every naval vessel having a set of these books, it is only necessary, in order to signal a message from one ship to another, to indicate the volume and the number in that volume corresponding to the required words or sentences. To do this there are nine rectangular flags representing the

digits, one to stand for zero or 10 and three triangular pennants called repeaters, wherewith to duplicate numbers. The lowest flag in the hoist represents the units. In addition there are special flags, comet danger signal, annulling flag, quarantine, convoy flags, etc., also the interrogatory answering, preparatory, numeral, geographical and position pennants. Flags of various colors are available as signals only for a distance but little over three miles. Beyond that long-distance signals are used, such as the semaphore, the collapsing drum or the use of cones, balls and squares—in which the shape takes the place of color. The wireless telegraph and wireless telephone have displaced to a great extent the older methods of signaling. Naval signaling according to the international code is mainly effected by flags, either singly or in groups, interpreted in accordance with the international code book. The present system is of gradual growth out of the earlier ones devised by Sir Home Popham (1803), Captain Marryat (1817) and others. The old international code introduced in 1857 was superseded by a new one in 1902. The latter was prepared in consultation with foreign governments and differs from the old mainly in having a complete flag alphabet, and in the substitution of three-flag signals for all the four-flag signals of the 1857 code, except in the names of places and of ships. See SIGNALS AND SIGNALING for a fuller description of the international code and illustrations of its symbols, etc.

Night signals are made by means of lights, rockets or torches. The waving of a lamp or torch approximates the wig wag and semaphore systems. Night signals are also made according to the system of Lieut. E. W. Very, United States navy, by which fire-balls or stars are shot to a height of about 400 feet. Only two colors are used, red and green, with which any desired signal may be made, a rocket being used to indicate a ship's number and as a signal of execution. Very lights are visible at a distance of 10 miles or more according to the state of the atmosphere. Ardois lamps are much used in the navies of the world—as used by the United States they consist of four pairs of lamps suspended along a cable extending to a masthead. The telegraph code is used, reading the lights from top downward, the red and white lights corresponding to the dot and dash of the telegraph or the one, two of the wig wag system. The lights are now operated by a key-board and a message may be transmitted quite rapidly. White lights are also flashed, long and short flashes indicating the dashes and dots respectively of the telegraphic system. The search light may be used for signaling a ship below the horizon, by reflecting the light on a cloud. Signals have been exchanged in this manner between two ships 60 miles apart. Day and night signals are those transmitted by sound or by wireless telegraph. By long and short blasts of a whistle or double and single strokes of a bell a telegraphic system is possible but only for limited distances. Fog-signals are made by firing guns, blowing horns, the steam-whistle and by sounding the ship's bell. Signals of distress are variously made, by hoisting the national colors upside down, by rocket, by blue lights, etc., or by the wireless

telegraph. A famous instance of the use of the last-named method was the wireless call of the sinking *Titanic* which sent the *Carpathia* speeding to the rescue over the intervening miles of water in time to pick up the survivors of that ill-starred vessel. Consult 'International Code of Signals' (issued by the United States Hydrographic Office, Washington 1914) and 'Instructions for Signaling, United States Navy' (ib.).

SIGNALS, Railway. See BLOCK SIGNAL SYSTEM.

SIGNALS AND SIGNALING. The most perfect means for the communication of messages by means of audible or visible signs to distances greater than can be reached by the human voice consists in the use of electricity. The telegraph and the telephone have displaced many old methods of signaling; but until the recent invention of wireless telegraphy the use of electricity required a more or less fixed connection between the place signaled from and the place signaled to. Flags of various shapes and colors, cones, balls, drums, movable arms or semaphores (as in railways), blasts of sound, flashes of light and other signaling media have been adopted for different purposes.

Marine Signals.—Signaling at sea according to the international code is mainly effected by flags, either singly or in groups, interpreted in accordance with the international code-book. The present system is of gradual growth out of the earlier ones devised by Sir Home Popham (1803), Captain Marryat (1817) and others. The old international code introduced in 1857 was superseded by a new one in 1902. The latter was prepared by a committee appointed by the Board of Trade and took its final shape after foreign governments had been consulted. The new code differs from the old one mainly in having a complete flag alphabet and in the substitution of three-flag signals for all the four-flag signals of the 1857 code, except in the names of places and of ships. The 27 flags used in the code comprise the "code flag," or

"answering pennant," hoisted before a code signal is given and as a sign that a signal has been understood; five pennants, denoting the letters C—G; two burgees, denoting A and B; and 19 square flags, representing the other letters of the alphabet. The number of three-flag combinations possible with the alphabetic flags is 15,600, thus affording scope for an immense variety of signals of all degrees of importance. PCJ, for instance, means, "You will find great difficulty in getting through the ice at —," the place being indicated by a following geographical signal. The code flag above two alphabetic flags gives latitudes and longitudes; under two flags, numbers. As already stated, in the new code four-flag signals are not used for general purposes. They may be used, however, in spelling words alphabetically; and as there is now a complete alphabet of flags, any word may be spelled in this way, but the code signals, having their own special conventional significations (all given in the code-book), are a means of more rapid communication. There are never more than four flags hoisted at once. When, owing to distance or the state of the atmosphere, the colors of flags cannot be made out, a system of distant signals must be selected. There are three systems of these in the code-book, so constructed that any one can be interrupted in terms of the elements of another, and all three in terms of the flag code. These systems involve respectively the use of (1) cones, balls and drums; (2) balls, square flags, pennants and whefts; and (3) a fixed semaphore. If the shapes are not to be had flags may be substituted; but shapes are more easily read than flags, because the latter flutter. A square flag is equivalent to a cone pointing upward, a pennant to a cone pointing downward and a wheft (or tied flag) to a drum. The code signals in all these systems denote things or meanings rather than words, and thus they can be interpreted by ships of all nations. The international code of signaling by cones, balls and drums, involves the use of the following alphabet:

In the most simple form of two-flag signaling, the code flag is hung up at the masthead or wherever it can be most easily seen, and single flags representing the alphabet are hung successively below. These flags do not bear a letter, but a design, which is more easily recognized at a distance than a letter. Each of the letter flags may be used to represent numerals, A to K standing for 1 to 11, L to S for 22, 33, 44, etc., to 99; T is 100, U is 0, V is 00,

in passing each other or a signal station, commonly signal their name, where from and where bound, number of days out and longitude of their chronometer. Naval vessels, of course, have their private codes, which are carefully guarded during war-time, that their signals may not be understood by the enemy. All officers are supposed to have glasses convenient for reading signals, when on active duty. Towing signals are made with a flag in the hand at the

W is 000, etc. The letter flags also each stand for a simple message, as follows:

A	I am on full speed trial.
B	I am taking in (or discharging) explosives.
C	Yes.
D	No.
E	Following flags to be taken as a spelled word.
F	End of word, or pause.
G	End of spelled words.
H	Stop, or come nearer; something important.
I	I have not a clean bill of health.
J	I have headway.
K	I have stern-board.
L	I have infectious disease on board.
M	Following flags to be taken as figures.
N	Decimal point.
O	End of numeral signals.
P	I am about to sail; all aboard.
Q	Have clean bill of health, but liable to quarantine.
R	Do not pass ahead of me.
S	I want a pilot.
T	Do not overtake me.
U	My engines are stopped.
V	My engines are going astern.
W	All boats are to return to the ship.
X	I will pass ahead of you.
Y	All ships of the convoy are to rejoin company.
Z	I will pass astern of you.

When a ship desires to signal, the method is to first hoist her ensign, with the code flag below. If several vessels are within signaling distance, she gives the signal letters of the vessel she desires to communicate with. To make reply, the other vessel hoists her answering pennant at "dip." The first ship then signals and holds the signal until the answering ship signals "Close up." Hauling down the ensign indicates that she has finished signaling. If the replying vessel cannot make out or understand signals, instead of answering "Close up" she signals OLW or WCX. Friendly ships,

gunwale. The distress signals begin with N, as NA, Aground; NB, Cannot save ship—take people off; NM, Am on fire, etc.

Army and Land Signaling.—For mechanical signaling the semaphore alphabet is still chiefly used. It can be rendered from signal stations by fixed semaphores or it can be worked in the field by a man with a flag in each hand. In such case the signal for starting is to cross the flags downward. The semaphore alphabet, as commonly rendered, is shown above.

The signal flags of infantry are valuable in locating companies and regiments when dispersed, as at the close of an engagement. The United States infantry signaling flags are:

FIRST BATTALION	Co. A, red flag with white square.
	Co. B, red flag with blue square.
	Co. C, red flag with white diagonal.
	Co. D, red flag with blue diagonal.
SECOND BATTALION	Co. E, white flag with red square.
	Co. F, white flag with blue square.
	Co. G, white flag with red diagonal.
	Co. H, white flag with blue diagonal.
THIRD BATTALION	Co. I, blue flag with red square.
	Co. K, blue flag with white square.
	Co. L, blue flag with red diagonal.
	Co. M, blue flag with white diagonal.

In the United States infantry, mounted orderlies and some others are required to carry in their kits two standard sets of flags and field glasses for reading them at a distance. Officers carry glasses that they may read signals. For heliograph signals, see HELIOGRAPH.

Weather Signals.—These have been highly elaborated by the United States Weather Bureau. For signaling forecasts a series of five flags is employed:

No. 1
White

Fair weather

No. 2
Blue

Rain or snow

No. 3
White and
Blue

Local rain or snow

No. 4
Black Tri-
angular.

Temperature

No. 5
White with
black square
in centre

Cold wave

The triangular temperature flag is placed above one of the others to indicate warmer, and below for colder weather. For storm signals red flags are employed; if there is a black centre a severe storm may be expected. The direction from which the storm may come is indicated by triangular pennants as follows: (Shading indicates red).

night are equivalent to beckoning in the daylight, meaning, "This is the best place to land." See LIFE-SAVING SERVICE, THE UNITED STATES. For Railway Signals, see BLOCK SIGNAL SYSTEM; SEMAPHORE.

SIGNATURES, Doctrine of, a mediaeval theory of medicine, which was carried into practice by those who believed that "God . . .

NW Storm

SW Storm

NE Storm

SE Storm

Hurricane

Whistle blasts as weather signals are used in many localities. There is sounded first a very long blast to attract attention. Then for fair weather, one long blast; rain or snow, two long blasts; falling temperature, one short blast; rising temperature, two short blasts; cold wave, three short blasts. These signals are usually repeated for exactitude.

Miscellaneous Signals.—In many cities fire alarm signals are given by a whistle system, sounding numbers, which can be interpreted by any one having a fire map and key. Such fire map and key are often printed in the local directory. Electric lamps have come to supersede lanterns in many fields of signaling. Different arrangements of red and white lamps can be made to give a great variety of information, when used with a code.

Common life-saving signals in the United States are a red light or rocket exhibited to a wreck, indicating that they are seen and help is coming. A red flag by day or a red light at night between the men in the service means "Haul away." A white flag or white light swung slowly means "Slack away." A white and red flag together (or white and red light at night) swung slowly means "Do not attempt to land by boats; is impossible." A blue pyrotechnic light has been used for the same purpose. Two torches burned close together at

maketh . . . herbs for the use of men, and hath not only stamped upon them a distinct form, but also given them particular signatures, whereby a man may read even in legible characters the use of them." Many names of plants were derived from these "legible characters." Thus, the color of plants often designated the particular kind of diseases to be cured by them. Such plants as the *Sanguinaria*, or bloodroot, so-called from the red juice which flows instantly upon bruising its fleshy stems, or roots, were naturally considered a cure for blood affections; and the herb-robert (*Geranium robertianum*), which assumes a beautiful red tint when dying, would staunch wounds. An infusion of the yellow bark of barberries (*Berberis*) was said to have been a cure for jaundice, as was also the saffron. Form was another index of medical virtues. The liverwort (*Hepatica triloba*), having a three-lobed leaf somewhat in the shape of the liver, and, furthermore, mottled with purple, when old was a cure for liver troubles; and the saxifrage, the "stone-breaker," so-called from its habit of growing in the fissures of rocks, as well as the stony seeds of granwell, were believed to be able to break up gravel. The well-known mandrake (*Mandragora*), and the ginseng (*Aralia*), valued by the Chinese, as love-charms and aphrodisiacs, gained their supposed virtues

on account of the fancied semblance of their forked roots to human figures. Even the seeds of ferns, at one time supposed to be invisible, transferred this quality to the possessor of the seeds, who thus himself became invisible; plants resembling the moon in her various stages, as the moon-daisy or the semi-lunar segments of the moonwort (*Botrychium lunaria*), were supposedly able, by involved and alchemistic reasoning, to cure uterine diseases, or were made party to magical performances, such as unshoeing horses which trod upon them. The rootstock of Solomon's seal (*Polygonatum*), when cut transversely, shows certain marks, imagined to represent a seal, which the old herbalists thought pointed to its employment as a styptic for wounds, and they told how the crushed rootstock would shortly take away bruises caused by 'women's wilfulness in stumbling upon their hasty husbands' fists.'

SIGNET, in England, one of the royal seals, used in sealing private letters and all such grants as pass the sovereign's hand by bill signed. It is always in the custody of the Secretary of State for the Home Department.

SIGNORELLI, sên-yô-rêl'ê, Luca, (*Luca d'Egidio di Ventura*, called also *Luca da Cortona*), Italian painter; b. Cortona, 1441; d. Arezzo, 1523. He studied first under Matteo da Siena and then under Pietro della Francesca. He began to distinguish himself about 1472, and painted until 1512, or perhaps later. He holds an important place in the history of art as the first who applied anatomical knowledge to painting, and thus became the precursor of Michelangelo. Signorelli painted in the Sistine Chapel at Arezzo, Città di Castello, Cortona, Perugia and Volterra; but his greatest works are the magnificent frescoes in the chapel of the Madonna di San Brizio in the cathedral of Orvieto. The series comprises the 'History of Antichrist,' the 'Resurrection of the Dead,' 'Hell' and 'Paradise.' It was begun by Fra Angelico about 1447, and finished by Signorelli between 1499 and 1504. These frescoes were studied by Canova, and by Michelangelo, who did not disdain to copy some of the figures for his 'Last Judgment.' Among his other works the most worthy of mention are the 'Madonna Enthroned,' the altar-piece of St. Onofrio in the cathedral of Perugia; the 'Adoration of the Magi,' now in the Louvre; the 'Annunciation,' and a 'Madonna,' at Volterra. Signorelli was a man of high character and attained municipal as well as artistic honors. Consult Crutwell, Maude, 'Luca Signorelli' (London 1899); 'Masters in Art' (Vol. VIII, Boston 1907); Dohme, 'Kunst und Künstler' (Eng. trans., 1880); Vasari, Giorgio, 'Lives of the Most Eminent Painters, Sculptors and Architects' (English trans., New York and London 1911).

SIGNS AND SIGNBOARDS. The art of sign painting was known among the Greeks and Romans and specimens of ancient signs have been found at Pompeii and Herculaneum, sometimes painted, but oftener carved. A bush was the sign of many taverns as late as the reign of James I. During the Middle Ages every trade had its emblem, some of which have survived, as the chemist's pestle and mortar, the pawnbroker's three balls and the barber's pole. Besides these trade emblems, every individual

trader might have his own special device: Southey's father, a Bristol linen-draper, for his chose a hare. During the 16th and 17th centuries huge painted signs came greatly into vogue. They were suspended either from projecting metal work from a post or an obelisk, or from a sort of miniature triumphal archway, and sometimes cost great sums. These creaking and ponderous signboards proved a source of annoyance, sometimes of positive danger, as when in 1718 one in Fleet street, London, dragged down a house front and killed in its fall four persons. So in 1762-70, under act of Parliament, the London signboards were either wholly removed or at least affixed to the fronts of the houses; and this example was gradually followed throughout the kingdom, though here and there signposts linger or have been restored, even in London. One of the oldest and most interesting signs still existing is the 'Red Lion' at Martlesham, Suffolk, England, for it was the figurehead of one of the Dutch fleet defeated off Southwold in 1672; but the history even of vanished signboards has no slight interest. A good many signboards have been painted by great artists, Holbein, Correggio, Paul Potter, Hogarth, Wilson, Morland, David Cox, 'Old' Crome, Sam Bough and Sir J. E. Millais (some of which are still extant). In the United States many old and picturesque signs are still to be found in Eastern cities, particularly in Atlantic Coast towns. Modern signs are made mostly of metal and wirenetting. Elaborate signboards indicating the trade or profession practised by the owner were necessary in an age when very few could read. With the spread of education among the masses they have become unnecessary. Lettered announcements now suffice to call attention to the wares within. Consult Larwood, Jacob, and Hotten, John Camden, 'History of Signboards' (London 1866).

SIGOURNEY, sig'ér-nî, Lydia Huntley, American author; b. Norwich, Conn., 1 Sept. 1791; d. Hartford, Conn., 10 June 1865. She received a good education, showed considerable facility in rhyme at an early age and many of her pieces were published in the periodicals of the day. For some time before her marriage to Charles Sigourney in 1819, she had been engaged in teaching in schools for young ladies. In 1815 she published 'Moral Pieces in Prose and Verse,' which was quickly followed by other works, most of which enjoyed great popularity. Among her principal poems are 'Traits of the Aborigines of America' (1822); 'Pocahontas' (1841); 'Scenes in my Native Land' (1844); 'Voice of Flowers' (1845). Her prose works are mainly biographical, historical, didactic and epistolary. In 1840 she visited Europe, and in 1842 gave some reminiscences of the tour in a volume entitled 'Pleasant Memories of Pleasant Lands.' She has been called the 'American Hemans,' and certainly rivals her English prototype in copiousness, having, by her own computation, written 46 works (in whole or in part), and more than 2,000 contributions to about 300 periodicals. Consult the autobiographic 'Letters of Life' (1866).

SIGSBEE, sig'sbê, Charles Dwight, American naval officer; b. Albany, N. Y., 16 Jan. 1845. He was appointed to the United States Naval Academy in 1859, was graduated in

1863, was made ensign in that year and for his first two years of service was attached to the *Monongahela* and the *Brooklyn* of the West Gulf squadron. He took part in the bombardments of, and attack on, Fort Fisher, and in the battle of Mobile Bay. In 1868 he attained the grade of lieutenant-commander. Thereafter he was employed in various duties, being at different times with the Asiatic and North Atlantic squadrons; stationed at the Naval Academy 1869-70; in the hydrographic office (1873-74); and commander of the coast-survey steamer *Blake* employed in deep-sea exploration for the government. The chief portion of the outfit of the *Blake* consisted of inventions or adaptations by Sigsbee, and in recognition of these he received a gold medal at the London International Fisheries Exhibition and the decoration of the Red Eagle of Prussia from Emperor William I. Promoted commander in 1882, he was successively on duty at the academy (1882-85); commander of the practice-ship *Dale* (1883-84), and of the *Kearsarge* on the European station (1885-86); and on shore duty (1887-90). In 1890-92 he commanded the training-ship *Portsmouth*, in 1893 was made chief of the hydrographic office, was made captain 21 March 1897 and on 10 April subsequent assigned to the command of the *Maine*. The *Maine* was designed at the Navy Department, built at the New York navy yard, commissioned 17 Sept. 1895 and the most powerful second-class battleship in the United States navy. In January 1898 the vessel was ordered to the port of Havana, Cuba, arriving there 25 January. There it was met by an official Spanish pilot and moored to a mooring-buoy chosen by him. At 9.40 o'clock on the evening of 15 February the *Maine* was destroyed by an explosion in which the entire forward part of the ship was utterly wrecked. Two officers and 264 of the crew perished. The United States court of inquiry appointed to inquire into the catastrophe found that the vessel was destroyed by the explosion of a submarine mine, and that no evidence was obtainable fixing the blame. A Spanish court making a simultaneous investigation reported that the disaster was caused by an internal explosion. It was very generally believed, however, in the United States that the loss of the ship was in some way due to Spanish initiative. Therefore, says Sigsbee in his own narrative, "although the war which followed was not founded on the destruction of the *Maine* as a political cause, that disaster was the pivotal event of the conflict." Sigsbee's wise dispatches at the time did much to suspend any popular demand for immediate reprisals, while his expert knowledge was of great value to the court of inquiry. He rendered distinguished service during the Spanish-American War as commander of the converted liner *Saint Paul*, with which on 24 May 1898 he captured the collier *Restormel*, securing Cervera's coal supply, and 22 June defeated the cruiser *Isabella II* and destroyer *Terror* off San Juan, Porto Rico. Subsequently he was ordered to command the *Texas*, in 1900-02 was chief officer of naval intelligence, in 1903 was made commander of the navy yard at League Island, Pa., and promoted rear-admiral. In 1904-05 he was commander of the South Atlantic squadron, and in 1905-06 of the second division of the North Atlantic fleet. He retired

16 Jan. 1907. He published 'Deep Sea Soundings and Dredging' (1880), and 'The *Maine*: An Account of Her Destruction in Havana Harbor' (1899).

SIGURD, zē'goord, or **SIGURDE**, a name famous in Scandinavian mythology. According to the legend Sigurd, the Siegfried of the Nibelungenlied, is the posthumous son of Sigmund, son of Volsung, a descendant of Odin; is born in the palace of Hialprek, king of Denmark, and grows up into splendid manhood. With his good sword Gram, which had once been wielded by Odin, he slays the dragon, Fafnir, and obtains the golden treasure which it guarded; by eating the monster's heart he is endowed with a wisdom which enables him to understand the songs of the birds. Riding off with his spoil he strikes through a lonely heath, in the midst of which is a volume of flame, surrounding a house in which a fair maiden Brenhyldr (Brunhild in the Nibelungenlied), daughter of Atli, lay asleep, never to be wakened until there came a hero brave enough to ride through the fierce flame. Sigurd enters and wakes up Brenhyldr, to whom he plights his troth, and then rides to the palace of Giuki the Niblung, who wishes Sigurd to marry his daughter Gudrun (Chriemhild). Gudrun's mother gives Sigurd a potion which causes him to forget Brenhyldr, and he marries Gudrun. Her brother Gunnar (Gunter), having determined to marry Brenhyldr, tries vainly to ride through the flames, and so his mother by her magic arts made Sigurd change shapes and arms with Gunnar, and so rescue Brenhyldr. On the bridal bed Sigurd places his sword between himself and Brenhyldr, and the following morning he resumes his shape, and hands her over to Gunnar. No sooner is this done than the power of the elixir passes off, and he sees when too late that he has betrayed his first love. After the lapse of years Brenhyldr is told that she was rescued from the flames by Sigurd and not by Gunnar, as she thought; and her love for the hero gives way to wrath and thoughts of vengeance. She urges Gunnar and his brothers to slay him, but as they had already taken an oath not to hurt him, they refuse. They, however, incite their half-brother to do the deed, and Sigurd is killed as he lay sleeping. The death of the hero revives all the love of Brenhyldr, and lying down by his side with the sword Gram between them, she dies broken-hearted on his funeral pile. Consult Boer, R. C., 'Untersuchungen über den Ursprung und die Entwicklung der Nibelungensage' (Halle 1906); Abeling, T., 'Nibelungenlied' (1907); Lichtenberger, H., 'Le poème et le légende des Nibelungen' (Paris 1891); Paul, H., 'Grundriss der germanischen Philologie' (Vol. III, Strassburg 1900).

SIGURD SLEMBE, slēm'bē', a trilogy by Bjørnstjerne Bjørnson, translated by W. M. Payne. This splendid sagadrama, so deeply impressive and so typically characteristic of Bjørnson, was planned by him already in 1858, when he was manager of the National Theatre in Bergen, but not completed until the author's stay in Rome in 1862. The author made a most thorough preparation for this work. Not only did he digest all that is to be found in the sagas about this unrecognized illegitimate son of Magnus Barefoot, king of Norway, but he

followed his hero in all his travels and adventures around in Europe in the early part of the 12th century. We find the whole spirit of the Middle Ages at the time of the Crusades in the very action, in the psychological exposition, in the tragic solution. *Sigurd Slembe* is the tragedy of the man whose great gifts and talents qualified him for leadership, but of whom his own country would not make use,—a theme which appealed to Björnson especially at the time when the drama was written. The ethical conflict is the same that the author has treated in some of his earlier novels and his saga dramas. According to one of Björnson's letters, it is the conflict, in a man highly gifted by nature, between the craving for self-assertion and the duty to submit one's powers to the demands of a higher and nobler aim. In the first section of the trilogy, 'Sigurd's First Flight,' the hero is presented to us, a powerful, handsome youth, full of energy and ambition. But he has no family name. In the opening scene he forces from his mother the confession of the name of his father. The poor woman at last reveals that King Magnus was her lover. At last he knows from what race he comes. He breaks away to seek adventures, to make a name and to return to claim the throne of Norway.

In 'Sigurd's Second Flight' we find the hero on the coast of the old Norwegian colony Caithness, Scotland, at the court of the exiled Earl Harold of Orkney. This sickly young man has no ambition and asks no more than that to be at rest among his dreams. But his life is tortured by the wranglings of his mother and her violent and intriguing sister. The two women seek the aid of the magnificent Norwegian who has arrived in their palace, nobody knows whence. An orphan niece, Audhild, one of Björnson's finest female creations, falls in love with Sigurd. The young man is eminently successful in his campaign against Orkney. The earl, however, commits suicide and Sigurd rejects the crown which now lies at his hand and passes out to sea again. He tears himself from the arms of Audhild in a scene of extraordinary beauty and passion.

'Sigurd's Return' is the closing play. King Harold Gille, Sigurd's half-brother, is with his court in Bergen. Our hero returns with the same hopes and illusions as when he left. Again, fate is against him. Two of the scenes especially are among the finest ever written by Björnson, the scene between Sigurd and the Finn girl, and Sigurd's sublime soliloquy: "The Danes desert me! The battle is lost! Here and no further!"

Failure confronts him as the result of all his toil. All avenues of escape are closed upon him. As he stands face to face with the ruin of the edifice he so nearly succeeded in erecting, all events of his past life come before him. He sees life in its true aspect. All worldly hopes being broken, Sigurd leans his weary head against the bosom of his aged mother while listening to the song of the Crusaders:

Fair is the earth,
Fair is God's heaven,
Fair is the pilgrim-path of the soul
Singing we go
Through the fair realms of earth
Seeking the way to our heavenly goal.

Johan Svendsen's 'Sigurd Slembe' is a musical illustration of the play. In America only the second section of the trilogy has been performed. It was in Chicago in 1908. The late Richard Mansfield had planned, after his venture with Ibsen's 'Peer Gynt,' to have the entire work condensed for a single evening's presentation and himself play the part of the hero.

GISLE BOTHNE.

SIHOENITE. See FERTILIZERS.

SIKA, sē'ka, the common deer of Japan (*Cervus sika*), representing a group (subgenus *Sika*), whose peculiarity is that the antlers have no bez-tine, so that each has usually only four points; the tail is long proportionately and the ischial white patch is bordered with black. The Japanese deer, abundant in the forests of northern Japan and China, is of small size, dark brown in color and the greater part of the tail white; but in summer the coat is spotted with white. This, and the similar Formosan and Manchurian deer, are often caught in traps and kept as pets by the people; and are capable of thriving in European parks. A closely related form is the Caspian deer (*C. caspicus*) of northern Persia. Consult Lydekker, Richard, 'Deer of All Lands' (London 1898).

SIKESTON, siks'tūn, Mo., city in Scott County, 125 miles southeast of Saint Louis, on the Saint Louis and San Francisco and the Saint Louis, Iron Mountain and Southern railroads. It manufactures flour and boxes, and has hoop and heading factories. Pop. 3,227.

SIKHIM, sikh'im, or **SIKKIM**, India, a native state under British protection, situated in the eastern Himalayas between Nepal and Bhutan, and between Tibet and the province of Bengal. Area, 2,818 square miles, and population 87,920. Of these 58,675 are Hindus. Buddhists number 28,915 and there are 285 Christians. It forms part of the south slope of the Himalayas and ranges in altitude from 18,000 feet in the north to 1,000 feet in the south. Its extreme length from north to south is 70 miles and its extreme breadth 50 miles. The climate is accordingly varied, ranging from tropical to alpine. Formerly most of the area was covered with forest, but the greater part below 5,000 feet has in recent years been cleared and cultivated. The chief products are maize and rice, oranges, apples and woolen cloth. A few copper mines are worked. The mountain roads are good, and the route of British trade with central Tibet passes through the state. In 1890 a treaty was signed by the viceroy of India and the Chinese representative, by which the British protectorate over Sikkim was recognized by China. The British government has direct and exclusive control over the internal administration and foreign relations. The Mahārāja, after having declined to comply with the conditions, lived for some time under surveillance in British India, and in 1895 was allowed to return to Sikkim. The Mahārāja and the members of the Council carry on the administration, with the assistance of the British political officer stationed at Gangtok. The inhabitants are Bhutias, Lepchas and Nepalese, the last named being now the most numerous. Principal towns are Gangtok, the capital, Rhenok, Rangpo, Pakyong, Lachen and Lachung. Lama-

ism is the common form of religion. The gross revenue is about \$72,500 annually. Consult Strahan, 'Report on Explorations in Sikhim' (Dehra Dun 1899); Waddell, 'Among the Himalayas'; White, J. Claude, 'Sikhim and Bhutan' (London 1909).

SIKHS, *sēks*, the name of a religious sect in British India, which has come in course of time to be virtually also the designation of a race or people. Nanak Shah was the founder of the sect, which worships only one omnipotent and invisible God, and whose tenets reflect the broadest religious philanthropy and toleration. Nanak Shah belonged to the Hindu tribe of the Vedis, and was born in 1469 in the village of Talwandi, now the town of Rajapur, in the province of Lahore. Nanak was a profound thinker, and far in advance of the views which prevailed in his day in any part of the world in relation to liberty of conscience and human brotherhood. His impressions in this regard were largely derived from the works of a Mohammedan named Kabik with which he became acquainted in his travels. He sought to introduce simplicity of faith and purity of morals, and to induce Hindus and Mohammedans to live in harmony. He died about 1540, and was buried at Kirtipur, which is, therefore, a place of pilgrimage for the Sikhs. He well deserved the honor in which his memory is held. His life was pure, he absolutely denied any power to perform miracles and he taught his disciples to worship God alone. Although peace between men was an essential part of the Sikh religion, the horrible persecutions to which they were subjected by the Mohammedans forced the Sikhs to become a military people, and under their great leader, Vovind Sinh, they fought so bravely and successfully as to receive the title of Sihns or lions. They wore a blue dress, let their hair grow and were always armed. Govind Sinh also instituted the order of "akalis" or "immortals," in whom to this day rests the supreme direction of religious affairs among the Sikhs. The struggle between Sikhs and Mohammedans and between independent communities of Sikhs continued until Runjeet Singh, the son of Maha-Singh, succeeded in establishing himself as despotic ruler of the Sikhs, about the close of the 18th century, and made himself master of a territory comprehending the whole Punjab and adjoining districts, with an area of 69,000 square miles. After the death of Runjeet Singh, and while his son, Dhulip Singh, a minor, was the nominal ruler, war broke out between the British and the Sikhs, in 1845. The struggle lasted with varying fortune, and intervals of temporary submission on the part of the Sikhs, until the decisive battle of 21 Feb. 1849, when the Sikh power was completely broken, their territory being annexed in the following month to the British Empire in India. The Sikhs have since proven faithful friends of the British, and never wavered from their allegiance at the time of the great Mutiny. They are now among the best of the British Indian troops. The Sabijdari are the leisure class of the Sikhs while the lower class are termed the Kesadhari. Their total number is in excess of 3,000,000. See also INDIA; RELIGIOUS SECTS.

SIKINO, *šē'kē-nō* or *sē-ké'nō* (ancient, *SIKINOS*), Greece, an island east of Melos, belonging to the Cyclades. It is 10 miles long by three wide. It has a rugged mountainous surface, but the soil is fertile. Wine is the staple. Its chief town is situated on the brow of a lofty precipice. In ancient times the island belonged to Athens, and in the Middle Ages to the duchy of Naxos. For centuries it was part of the Turkish dominions in Europe, but its Greek population secured its inclusion in the modern kingdom of Greece.

SIKSIKA, *sīk'sī-kā* ("Blackfeet," by which name they are popularly and officially known), an important tribe and confederacy of the Algonquian stock of North American Indians, the confederacy comprising the Siksika proper, the Kino or Bloods, and the Piegan. They should not be confounded with the Blackfoot division of the Teton Sioux on Standing Rock Reservation, N. D. The early Siksika home was the country north of Lesser Slave Lake, but in the middle of the 18th century they appear to have lived on the west side of Lake Winnipeg, whence they were forced westward by the Crees; 40 years later the Siksika proper occupied southern Saskatchewan River, while the Piegan lived on its headwaters, after which time the latter, followed by the Siksika, moved down to the Missouri River. Early in the 19th century the home of the Siksika was northern Montana and the adjacent part of British America, extending from the Rockies to the junction of Milk River with the Missouri, and from Musselshell River in Montana to Saskatchewan River in Canada. The component tribes of the confederacy are now gathered on reservations within these limits, the Siksika and the Kino or Bloods being mainly under Canadian rule, while the Piegan, who constitute about half the confederacy, are chiefly in Montana. Both the men and women are tall and well formed; they practised polygamy, and on the death of the husband his wives became the potential wives of his eldest brother, while his property descended to his sons or, if he had none, to his brothers. These Indians were always noted for their warlike character, their hostilities being conducted chiefly against the Cree, Crows, Shoshoni, Kutenai and Flatheads. They relied mainly on the buffalo for subsistence, their food, clothing, shelter and some of their implements and utensils being derived from this useful animal. They lived in skin tepees and besides bags and cases of hide or parfleche, made implements and utensils of stone, bone, horn and wood, but no pottery or basketry. Marriage within the gens was prohibited, but this rule is not now strictly observed. Each gens had its chief, and the chiefs of the gentes chose the tribal chief, but the power of the latter was in the main only advisory. The Siksika are nature worshippers, their principal deity being the sun, whose wife is the moon, and whose surviving child is the morning star, while physical objects and forces are minor deities. In the latter part of the 18th century these tribes were estimated

at 12,000, but they lost about a third of their number by smallpox in 1836, and in 1858 aggregated only about 7,300. The number of Siksika, Bloods and Piegiens on reservations in Alberta is now about 3,000, and the population of the Piegiens on the Blackfoot Reservation in Montana is less than 2,000. Consult Hodge, F. W., 'The Indians of North America' (Washington, D. C., 1906).

SILAGE, or ENSILAGE, green fodder preserved in a succulent state by exclusion of air; where it undergoes certain changes. In the United States Indian corn (*Zea mays*) is pre-eminently the crop for silage, so when other crops are utilized a designatory adjective is prefixed, as clover-silage, etc. Silage may be stored in silos, or air-tight structures, made of wood, brick, stone or concrete reinforced with iron. Square, octagonal and rectangular silos are in use but the round silo is the most common. Until recently lumber has been the cheapest material but concrete has been steadily gaining in popularity both because of its permanence and its being more air-tight. The cylindrical form is also preferred because it requires the use of less material, contains less waste space and presents the greatest strength, pressure being distributed equally at all points from the centre. When placed in silos, the fodder is usually cut or shredded into short lengths so that it will occupy less space, incorporate less air and undergo less fermentation than when packed uncut. In Europe grass is frequently stacked in the open or put into clamps or pits without cutting it into lengths. The use of the silo in one form or another dates back to antiquity, the clamp being probably the oldest form. About a hundred years ago this method of preserving fodders attracted attention in Europe and in 1875 Dr. Manly Miles of Michigan, and in 1876 F. Morris of Maryland, introduced the system into the United States. Many extravagant claims were advanced in its behalf by early enthusiasts, and lack of knowledge led to numerous failures, so that the progress made was small for some years. In 1882 but 92 farmers could be found who used the silo in the United States. The work of Professors McBryde and King, of the Wisconsin and other agricultural experiment stations, made the position of the silo and silage secure. To-day the livestock and dairy farm is considered incomplete without one.

The size of the silo is important, serious losses occurring from lack of proportion between the size of the silo and the amount of silage fed daily. The exposed surface is usually too great. The upper layer, if exposed, spoils; hence about one and two-tenths inches should be fed each day from the whole surface and two inches would be better. A cow will consume 35 to 40 pounds a day, so if a cubic foot weighs 40 pounds, we may allow five to six square feet by two inches thick for each cow a day. Silos less than six feet in diameter are not considered to be practical on account of the friction of the walls preventing the contents from settling properly, because the greater surface in proportion to bulk means greater percentage of loss. Deep silos are preferable to shallow ones, as a 36-foot silo will store nearly five times the amount that a 12-foot one will, the diameters being equal. King calculates

that the average weight of a cubic foot of silage from a silo 10 feet deep is 187 pounds, while the average from one 36 feet deep is 428 pounds. All silos should be at least 20 feet deep and 30 feet is better. The pressure of the silage when settling increases with the depth at the rate of 11 pounds a square foot for each foot of depth, hence, at 10 feet down the lateral pressure is about 110 pounds a square foot; at 20 feet, 220 pounds, and at 30 feet, 330 pounds; therefore, the hoops of a wooden silo and the iron bands in a concrete one should be larger, stronger and closer at the bottom of the silo than at the top, the first one starting six inches from the bottom, the second a foot above the first, increasing the space six inches with each hoop, until near the top they are finally four feet apart.

The crops used for silage include corn, millet, common red and alsike clover, rye, vetch, oats, pea-vine, sorghum, kafir corn and alfalfa. The making of silage from several of these crops has scarcely passed the experimental stage. This is not so much because they cannot be preserved as because corn has proved so unsatisfactory. The low cost and ease with which heavy crops of corn can be produced; the slight losses sustained in the silo (2 to 10 per cent), and the few objectionable features that corn silage has, render it the general purpose crop. The percentage of losses which occurs in drying corn fodder in the field under good conditions is about the same as that attending its loss when converted into silage. The cost of growing and placing a ton of silage in the silo generally varies between \$1.75 and \$2.50. The Southern dent varieties produce the heaviest crops, and, if they mature sufficiently in the district, are generally grown. The best time to cut corn for silage is when the kernels are "in the milk" stage of maturity but the stalks, leaves and husks green, as under these conditions less fermentation and other losses occur. Millet has been tried to a small extent. Clover makes good silage, but the unavoidable losses are higher than with corn. This crop should be cut when the bloom has begun to turn brown. Rye and oats, owing to their hollow stems which carry considerable air, are subject to serious loss in weight when made into silage. Pea-vine silage is a by-product of canning factories. Alfalfa silage is still in the experimental stage. Grass is used for silage in the United Kingdom.

THE AVERAGE PERCENTAGE COMPOSITION OF CORN SILAGE.*

Other carbohydrates and acids (by difference).....	25.6718
Ether extract.....	7.66

When corn is nearly mature before being siloed it will be more palatable and probably more digestible than if cut while younger or when fully ripe. The digestibility of corn silage and dry fodder corn are about the same.

*Larson and Putney.

both being somewhat less digestible than green fodder.

Silage is pre-eminently a food for the cow, so its use will largely remain with the dairy farmer. Feeding trials with dairy cows show that silage usually gives better results than a corresponding amount of dry fodder. It has been ascertained that the use of silage produces from 4 to 5 per cent more milk and fat per 100 pounds of dry matter feed, due to the silage being more acceptable, and the stalks of corn being cut up in the silage and eaten, instead of rejected as when fed in the form of corn fodder. In feeding great care must be exercised not to leave unconsumed and putrifying silage about the stables as the odor may taint the milk. Several milk-condensing factories formerly refused the milk from silage-fed cows, but proper rules for feeding and also inspection have removed the objections of the condensers. Experts may detect a silage odor or flavor in milk from silage-fed cows, but this is of little import, as such milk, and butter made from it, are now sold to critical customers in cities at high prices. When used for fattening cattle, silage produces a more watery carcass than dry fodder. It is a good feed for sheep, being especially useful for ewes with lambs at foot. It is not adapted to pig feeding nor to work horses, but small amounts may be fed to idle horses. Consult King, 'Physics of Agriculture' (Madison, Wis., 1899); Larson and Putney, 'Dairy Cattle Feeding and Management' (New York 1917).

SILAO, sē-lā'ō, Mexico, a town in the state of Guanajuato, situated on the Mexican Central Railroad, 15 miles southwest of Guanajuato. It is the centre of a rich agricultural district, and manufactures cotton and woolen goods. Pop. 14,059.

SILAS MARNER, a brief novel written by George Eliot (MARY ANN EVANS) in 1861, has always been one of the most popular as it is among the greatest of its author's works. The scene of the story is laid in the typical English village of Ravelow, at a time "when the spinning wheels hummed busily in the farmhouses." Against a picturesque and realistic background of rural life and custom George Eliot has set the strange and alien figure of the weaver, Silas Marner, who has come hither as an outcast from a narrow religious community in the city, where he has been unjustly convicted of robbery. Utterly broken in spirit, bankrupt of his simple faith, and cut off from all kindly human interests he becomes a miser, cherishing the ever-growing heap of his earnings at the loom as the sole object of his starved affections. When his gold is stolen by the vicious Dunstan Cass, younger son of the village squire, his life is left utterly barren and he becomes practically insane. At this crisis the abandoned wife of Godfrey Cass, Dunstan's elder brother, perishes in the snow before Marner's hut, and his child, Eppie, is found by Marner and welcomed as a providential gift sent to replace his stolen gold. The theme of the novel is the transformation in Marner's life, the restoration to his simple and affectionate soul which comes with this substitution of a human love, demanding care and sacrifice for the miser's perverted love of gold. Interwoven with the story of Silas is that of

Godfrey Cass, the good-hearted, but weak and badly brought up father of Eppie, who pays for his unwillingness to accept the consequences of his unworthy marriage, by seeing Eppie, now grown to womanhood, adhere to her foster-father even when Godfrey and his second wife, Nancy, at last tell her the truth about her parentage and would gladly welcome her to their childless home. The story is as beautiful as it is significant. The variety of the characterization, the consummate handling of the narrative, and the profound moral insight of the author make this novel an unquestioned masterpiece in English fiction.

JAMES H. HANFORD.

SILAY, sē-lī', Philippines, pueblo or town of Negros Occidental, on Guimaras Strait, 10 miles north of Bacólod. It is a large and prosperous town open to coasting trade, and is a telegraph and military station. Pop. 15,649.

SILCHESTER, sīl'chēs-tēr, England, a village in Hampshire, seven miles north of Basingstoke, of special archaeological interest. Here are the ruins of Caer Segeint, or Calleva Atrebatum, a Roman town, the main features of which are an amphitheatre, and the city walls, 2,760 yards long. The foundations of a basilica, forum, baths and a temple have also been excavated, and rings, coins, seals, broken pottery in abundance have been found near the surface. Antiquarians have given the place much study. Excavations were begun by Joyce in 1864 but it was not until 1890, when the Society of Antiquaries took up the work, that the excavations were systematically carried out. By 1910 nearly all the ancient town had been uncovered, disclosing very many interesting remains. All portable objects now repose in the Reading Museum. Consult Haverfield, F., 'The Romanization of Roman Britain' (3d ed., Oxford 1915) and *Archæologia* (Vols XL, XLVI, LII et seq.), containing plans, illustrations, etc.

SILENACEÆ, a family of plants, of which the pink, named by botanists in early times *Caryophyllus*, and more recently *Dianthus*, may be considered as typical. The plants of this family are readily distinguished by their opposite undivided leaves, without stipules, the tumid articulations of the stems and the disposal of the seeds upon a free central placenta, surrounded by several carpellary leaves. Several species are cultivated by florists; a few are used in medicine, and *Saponaria officinalis* and *Lychnis diurna* yield a mucilage resembling soap. The Clove-pink (*Dianthus caryophyllus*) is the origin of all the cultivated varieties of carnations, picotees, bizarres, flakes, etc.

SILENE, a large widely distributed genus of the pink family (*Caryophyllaceæ*), having opposite leaves, and five-merous flowers, with a more or less inflated calyx. The silenes are either annual or perennial and of varying habit and inflorescence. Many species are viscid pubescent as *Silene virginica*, *S. caroliniana*, and *S. viscosa*, the last the catchfly, which is carnivorous to a slight degree and holds its victims by its stickiness. In general, however, the viscid stems prevent crawling insects, such as ants, from stealing honey and both common and generic names refer to this characteristic. *Silene nutans* and *S. noctiflora* are now naturalized in America and are faded and unattract-

ive in the daytime, but are in full bloom, with starry white petals at night, attracting night-flying insects by their fragrance. Another naturalized silene, found at the borders of fields, is the *S. vulgaris*, a glaucous tall plant, known as bladder campion, cowbells, behen, and spatting or frothy poppy. The first two names refer to the inflated calyx, which is much more conspicuous than the white notched petals protruding from the top, and in fruit is nearly globose, nodding in cymose panicles. It is of papery texture, tinted pale green flushed with rose and is reticulated with delicate veinings. It is said that English peasants have eaten its young shoots, tasting like green peas, instead of asparagus. The moss-campion (*S. acaulis*), a tufted perennial covered with reddish purple flowers, is common to Arctic regions and mountains; the sweet-william catchfly (*S. armeria*), with rose-colored flowers; and the fire pink (*S. virginica*), whose crimson flowers blaze in southern dry woods, are all cultivated, to which the northern wild pink (*S. caroliniana*) might well be added, as it has many rose-colored or white flowers in very early spring.

SILENT CHAIN, an improved form of link-belt consisting of a broad band of metal links the ends of which project inward of the belt circuit forming cog-shaped teeth which engage in a broad-faced toothed gear wheel. This chain belt has the advantage of working perfectly where the pulley shafts are necessarily close together, and are especially adaptable in the transmissions in automobile machinery. They have the additional advantage of being practically noiseless. See **POWER TRANSMISSION**.

SILENT PARTNER, called at various times and places a dormant, sleeping or special partner. In commercial phraseology a member of a firm or corporation whose name does not appear publicly in the concern, but who shares the responsibilities and liabilities of the organization. Generally a partner of this sort takes no active part in the management of the business, outside of giving monetary support or receiving his portion of the profits. See **PARTNERSHIP**.

SILENUS, sī-lē'nūs, represented in ancient mythology as the mentor and companion of Bacchus, the god of wine. Silenus, according to the legend, was generally drunk himself. He is sometimes represented as treading out grapes and other times as riding on an ass with the infant Bacchus in his arms. Various legends about him were current in antiquity especially in Asia Minor, where his worship first took concrete form. Consult 'Dictionary of Greek and Roman Mythology'; and 'Gruppe, Otto, 'Griechische Mythologie und Religionsgeschichte' (2 vols., Munich 1906).

SILESIA, sī-lē'shī-a (German **SCHLESSEN**), a former Bohemian duchy, later divided between Prussia and Austria, and under the Peace Treaty of 1919, with a section assigned to Czechoslovakia.

Prussian Silesia is a province in the southeast of the kingdom, length 230 miles, breadth 80 miles; area 15,569 square miles. The region is traversed lengthwise by the great longitudinal valley of the Oder. That river flows from southeast to northwest, and with its numerous right and left branches drains prac-

tically the whole of its area. To the west of this great valley the surface is taken up by the eastern slope of the Sudetic Mountains with its numerous spurs and minor ranges. East of the Oder the land rises in several more or less isolated and hilly, but not high, plateaus. Nearly nine-tenths of the forests are coniferous. The region is rich in mineral resources. Its coal deposits are the richest in Germany. Iron and zinc are mined in large quantities and lead and silver are also found. An average annual production of coal in normal years is 40,000,000 metric tons; of zinc, 600,000 metric tons, while of iron and lead considerably less quantities are produced. The climate in the lowlands is favorable for agriculture and the valley of the Oder is very fertile and one of the richest wheat and barley regions in the empire. Oats, rye, buckwheat, potatoes and fruit are also raised in large quantities and there is some viticulture. The textile industry is the most important, next to which follow the metal industries and others depending on mining and quarrying, such as the manufacture of cement, porcelain and glass. Lumbering and the manufacture of paper, beet-sugar, starch and liquors are also important. About 1,600,000 people depend on agriculture for a livelihood, while 1,750,000 are engaged in industrial occupations. Besides the main Oder there are scarcely any navigable waterways. There are about 2,500 miles of railroad. Pop. about 5,225,962. The capital is Breslau (515,000) which is the principal industrial centre. Silesia elects 35 members to the Reichstag and 65 to the Landtag. Other populous centres are Görlitz (85,000), Königshütte (72,000) and Beuthen and Liegnitz (each 67,000). Of the population 2,960,800 are Roman Catholics, 2,199,000 Protestants and 45,000 Jews.

Austrian Silesia is a crownland and duchy situated between the southern part of Prussian Silesia and Moravia and bounded on the southeast by Galicia and Hungary. It measures 115 miles from northwest to southeast, with a breadth of 20 miles and an area of 1,987 square miles. The northwestern part belongs to the Sudetic Mountains, the southeastern to the Carpathians, and in the middle is the transverse valley of the Oder. The chief mineral products are coal and iron, the coal amounting to about 7,500,000 tons annually. Agriculture is confined to the central lowlands and yields grain, sugar-beets and fruit. The industries are more important; there are machine shops, steam textile mills, beet-sugar factories, distilleries, etc. There is a considerable transit trade in Austrian wines, salt and also in beef. Pop. 756,949. Of these 639,000 are Roman Catholics and 102,000 Protestants. German is spoken by 48 per cent of the people, Polish by 33 per cent and Czech by 29 per cent. Troppau, the capital, has 31,000 inhabitants. Other cities are Ostrau (22,000), Teschen (22,000) and Bieleitz (18,000).

In the early Middle Ages Silesia was inhabited by a Slavonic people supposed to have supplanted an earlier Germanic population. In the 10th century it was incorporated with Poland. In the latter part of the 12th century it was made a separate duchy by the intervention of Frederick Barbarossa, and from this time Silesia began to undergo Germanization, chiefly by the immigration of German colonists. In the 13th century the duchy was divided into

numerous and semi-independent principalities, which sought the protection of Bohemia against Poland. By the middle of the 14th century they had become actual vassals of the Bohemian king, and in 1526 they passed with Bohemia into the possession of the house of Hapsburg. In 1675 Frederick William, the "Great Elector" of Brandenburg, laid claim to Silesia based on a former agreement of mutual succession. The emperor refused to recognize the claim and the three Silesian wars followed, which ended in 1763 with the supremacy of Prussia over what is now Prussian Silesia. During the European War several parts of Austrian Silesia were invaded by the Russian armies, but after a short occupation they were repulsed beyond the frontier. Under the Peace Treaty of 1919, the Czech inhabited section of Silesia (area, 1,988 square miles; pop. 756,949) was assigned to the Czechoslovak Republic. Consult Morgenbesser, Michael, 'Geschichte von Schlesien' (4th ed., Breslau 1908).

SILHOUETTE, *sīl-oo-ēt'*, is the representation in solid black of the outlines of an object, occasionally with a few assisting lines drawn in white. The name comes from Etienne de Silhouette, French Minister of Finance in 1759. He strove by severe economy to remedy the evils of a war which had just terminated, leaving the country in great exhaustion. At the end of nine months he was obliged to leave his place. During this period all the fashions in Paris took the character of parsimony. Coats without folds were worn; snuff-boxes were made of plain wood; and, instead of painted portraits, outlines only were drawn in profile. All these fashions were called *à la Silhouette*; but the name remained only in case of the profiles, because the ease with which they may be drawn, or cut out of black paper, makes them popular, though considered as works of art they have little value. Some faces—those with a marked profile—are easily taken in this way; while others lose their character entirely, particularly those whose traits are well harmonized. These representations may be taken very well from the shadow of a person on a paper held on the wall; and, in order to make the shadow more steady, it is well to rest the head on a book or the like, put between the face and the paper. The paper is then cut according to the outline of the shadow and the outer surface pasted on black paper.

SILICATES, a great group of minerals, compounds of various elements with silica. (See **SILICA**). The group includes a few important ores, but is chiefly significant as the great group of rock-forming minerals. A discussion of the important minerals of this group will be found in the introduction to the article on rocks. See also **FELDSPAR**; **AMPHIBOLE**, etc.

SILICIFIED WOOD, a variety of the minerals quartz or opal in which the mineral has replaced the wood. Opalized wood is wood changed into opal; petrified wood includes either of the above as well as wood changed into coal (see **PALÆOBOTANY**). According to J. D. Dana the trees now silicified in Arizona seem originally to have flourished on the shores of an inland lake, into which they fell and became water-logged; then they were buried

beneath volcanic material of a highly silicious character which underwent alteration through the action of water setting free more silica than the water could hold in solution. As the wood decayed this silica was deposited in its cells until finally the woody fibre completely disappeared and what was once wood became quartz. As this change took place only particle by particle, the minutest cells of the wood are preserved and may be seen under the microscope. In the great petrified forests of Arizona, now a government park, there are trunks of trees three or four feet in diameter and over 100 feet in length, completely changed to quartz. Over the whole section are scattered petrified trunks and fragments from the size of a hickory-nut to several feet in diameter. At one place in the park a petrified tree has fallen across a ravine about 50 feet wide, forming a natural bridge. This Arizona petrified wood has been extensively exhibited and sold under the trade names of "jasperized wood," "agatized wood" and "woodstone," having been manufactured into tiles, paper-weights, cane and umbrella handles and many novelties, while complete transverse sections have been mounted as table-tops. The material is partly jasper, richly colored red and yellow by the oxides of iron and partly translucent chalcedony, with occasional spots of clear quartz and amethyst. Silicified wood abounds in the Rocky Mountains, while a similar forest exists in the Yellowstone Park. Opalized wood is also common, especially in California and Oregon. Consult Merrill, 'Fossil Forests of Arizona' (1911). See **FOSSILS**.

SILICIOUS SINTER. See **GEYSERITE**.

SILICON, in chemistry, one of the non-metallic elements, symbol Si, atomic weight 28.4. Next to oxygen it is the most abundant element found in the earth. It does not occur in nature in the free state but in combination with oxygen (silica) and with oxygen and various metallic elements as potassium, sodium, aluminium, calcium, etc., in the form of silicates. Silicon may be prepared by heating a mixture of metallic sodium and the double fluoride of sodium and silicon ($\text{Na}_2\text{SiF}_6 + \text{Na} = 6\text{NaF} + \text{Si}$); also by action of heat on a mixture of magnesium and silica (sand). It exists in three allotropic forms, an amorphous brown powder, a graphitoidal and a crystalline variety. The amorphous form is insoluble in all acids except hydrofluoric; it dissolves in potassium hydroxide to form a silicate, and burns in the air at high temperatures to SiO_2 . The crystalline variety is very hard, is but little if at all attacked by hydrofluoric acid or potassium hydroxide and cannot be burned. Silicon forms compounds with oxygen, sulphur, chlorine and some others but the most important are the oxide SiO_2 and the salts derived from the various silicic acids.

Silica, SiO_2 , oxide of silicon, occurs very abundantly in nature both in crystalline and amorphous forms. Quartz, a very pure form of silica, crystallizes in six-sided prisms terminated by six-sided pyramids. The finer crystals of quartz are called rock crystal, while the imperfectly crystalline varieties occur in a number of forms. Of the cryptocrystalline and amorphous forms we have opal, agate, amethyst, flint, sand, etc. Silica can be obtained in a fine

state by melting sand or a silicate with sodium carbonate whereby a silicate of sodium is formed. This is dissolved in water and hydrochloric acid added. Silicic acid separates in a gelatinous condition. The whole is evaporated to dryness, heated for a time a little above the boiling point of water and then washed with dilute hydrochloric acid. The silica is left behind as a gritty white powder insoluble in water and in most acids. Hydrofluoric acid dissolves it, however, with the formation of silicon tetrafluoride (SiF_4). It also dissolves in alkalis to form silicates. Silica is not acted on by heat except that of the oxyhydrogen blowpipe which fuses it. Silica, generally in the form of sand, is used largely in the preparation of mortar, glass and pottery. In metallurgical operations it is used as a flux with ores containing limestone with which it forms a glassy slag which floats on the molten metal carrying with it many impurities from the ore. Silica forms a number of hydrates which have acid properties and from which a vast number of salts are derived. A great many very complex salts of these silicic acids are found in the earth's crust, the metallic elements being usually sodium, potassium, magnesium, aluminium, calcium and frequently small amounts of other elements. Some of the best known silicates are the minerals feldspar, mica, garnet, talc, meerschaum, etc. Clay is largely

a silicate. See QUARTZ; ELECTROCHEMICAL INDUSTRIES.

SILICON CARBIDE. See ELECTROCHEMICAL INDUSTRIES.

SILIUS, Titus Catius Italicus, Roman poet: flourished about 25–101 A.D. At Rome he applied himself to the bar, and became a celebrated orator and advocate. He was consul at the time of Nero's death and incurred some reproach for assisting in that tyrant's prosecutions, but acquired honor from his conduct in the proconsulate of Asia, assigned to him by Vespasian, from which he retired into private life, and collected books, statues and busts of eminent men. He finally retired to his seat in Campania, where he died. The only work of Silius which has reached modern times is an epic 'Punica' in 16 books, written with more diligence than genius. It takes as its theme the Second Punic War, according to Livy and Polybius, and contains occasional splendid passages; the description of the passage of Hannibal across the Alps is particularly admired. There are editions by Drakenborch (1717), Ruperti (Göttingen 1795–98, two vols.), and Bauer (Leipzig 1891–92). Consult Butler, H. E., 'Post-Augustan Poetry' (Oxford 1909) and Schanz, Martin, 'Geschichte der römischen Litteratur' (Vol. II, pt. 2, 3d ed., Munich 1913).
